To do 2,000 cubic feet, 1s, 9d, each.

* . * Showing a cost for fumigating of only 8d. per 1000 cubic feet of svace.

TESTIMONIAL.

From W. H. WHITTAKER, Gardener to Sir Hickman B. Bacon, Bart, Thonock, Gainsborough.

"I am truly pleased to add another to your list of testimonials, as your Fumigator is undoub edly the best I have ever u ed. I find it certain death to all usect jests, whilst the most tender foliage is not hurt in the least. When I took charge here, the Peach house was in full bloom, and was infested with both scale and fly. As you remember, I wrote, asking if yoo coosidered it safe to fumigate under the circumstances. I followed your advice, and the result was surprising; after once fumigating, the fly was all dead, and most of the scale. I told this to a neighbouring gardener, who, out of curiosity, came to witcess my second application, which was in the evening; test morning, we found all the state, old and young alike, "quite dead." My friend, like myself, was delighted. I have hom circulars, which he took to his employer. Mr Fearson Morton House, Gainsborough, whom I understand obtained a No. 2 Set, which has given every satisfaction. After using your Fumigator, one feels he cannot praise it too much."

To be had from a'l Nurserymen, Seedsmen, Florists, and Sundriesmen; or, direct from the Sole Proprietor,

Gardeners' Chronicle.

SATURDAY, OCTOBER 3, 1896.

BADEN-BADEN.

FTER the lapse of a few years I again find A FTER the tapse of a rew years - 2 myself in this favoured spot. There are few towns which I like better than Baden-Baden, and after a rather long run on the Continent, it seems to me still to hold its own, and can bear comparison with other localities of the sort. But, of course, my attraction to this part of the world does not come from the richlywooded hills, or the bright streets and villas, or the old Schloss, or anything else that might be named, as it does from the Botanischer Privat Garten, and the well-known genius who presides over it, and to whom we are all indebted for so many of the attractions which our gardens possess. His many friends in England will be glad to know that Herr Max Leichtlin seems to me to be very much as he was a few years ago, when I last had the pleasure of seeing him. At any rate, his interest in his garden is quite unabated, his activity seems to be just the same, his friendliness and willingness to help one in every way is what I have known it to be for many years past; and I hope and believe that this centre of interest for all the lovers of flowers has a long existence before it, and that he will yet gather in from his borders multitudes of rare seeds with his own han is for many years to come, and send forth, if it be possible, even grander, and brighter, and more interesting things than we have yet had from him. But a word about the garden and its ornaments at this season of the year may, perhaps, be acceptable to those who have not seen it of late.

It should be remembered that the year is hastening onward towards the close. are patches of yellow in the woods, the Walnuttree beneath my window has just been stripped of its load, and autumn asserts itself on every side in a way which cannot be mistaken. This is far from being the time when one would choose to visit Max Leichtlin's garden, or expect to find very much of blossom in it, but I felt certain that even now I should not come in vain, and that expectation has been verified. For one thing, let me say the Kniphofias are such as I have never seen elsewhere. K. Nelsoni is of great value, because it blossoms the latest of all, and it is certainly one of the loveliest and most elegant of them. K. natalensis is the most highly-coloured of the lot; K. Triumph has a kind of bright yellow candelabra-like habit of flowering; and a small yellow one which is not very tall, and has not as yet been named, struck me very much indeed, and is certain to please. But perhaps I may as well say at once, that new is Coriaria nepalensis—it was so entirely new to me. Max Leichtlin says it has been in full beauty since last July, and is likely to be so till the frest sets in. The crystalline, deep yellow fruit is attractive in the highest degree, and when the statement is added that the shrub is quite hardy in this part of the world, it will be seen that this acquisition from the Himalayas is of great value, and will be much sought after.

There was a new Hedysarum in the borders which I liked very much; Trachelium rumelianum is a nice little flower, and I saw many specimens of Campauula mirabilis, of course not in blossom just now, from which great things are expected. Liatris cylindracea is still very nice, but I am told it is far from the best; I think it is L. graminifolia that Leichtlin praises the most, but its time had gene by. Thalictrum Delavayi has no need of mention from me, but I never saw such fine specimens as there are here, and there seem to be two varieties which differ very much in the foliage, but are in other respects alike. Some Lobelias are still very attractive. L. fulgens rosea and L. f. violacea correspond with their names, and they brighten up the borders exceedingly; they differ from what I have as yet come across. Calceolaria alba should not escape notice, it will be a valuable little shrub if only it is sufficiently hardy. In one of the houses I saw an Agapauthus, which throws all others into the shade; it rejoices in the name of A. maximus var. Krelagei; and while any Agapanthus is good, this must be put in the first rank of all, where autumn flowers are looked for. Close by it was a very large Belladonna Lily, Amaryllis Belladenna rosea perfecta, a beautiful thing in its way. But I could extend my list of plants and bulbs which are in blossom, even now, to a very great length. Sternbergia macrantha is in all its glory at present; I suppose it is one of the finest of Mr. Whittall's many introductions-the only draw back that it has is, that it is naked stemmed, and blossoms without the leaves. Gerbera Jamesoni seems to be quite at home with Max Leichtlin, though it is strange to hear from him that it has not done well lately in the way of blossoming, because of the continuous wet. I have a plant at Ryde which must be four or five times as large as any which are here; and though very robust and strong, it did not blossom well this summer in one of the hottest and driest places that could be conceived. If sunshine in one locality puts it out, and rain in another, what are we to do with it? My plant did splendidly in the summer of 1894 and 1895, but it has quite failed this year; and I hear from my gardener that it has done nothing since I left home, some six or seven weeks ago, though it is in a very robust and healthy condition.

I might weary your readers if I mentioned everything that interested me this morning. Scabiosa Hookeriana is a novelty which has seen its best for this season. I think Max Leichtlin said it had been a puzzle to him for fifteen years. He has two or three good Delphiniums which have not as yet found their way into commerce; one is a sort of dark claret colour, which had not at all begun to fade. I noted flowering plants of Galanthus Olgæ Regime, but it is nothing more than G, nivalis, with a very precocious disposition, which makes it outstrip all its compeers in earliness; it is, nevertheless, well worth possessing, for by its aid all lovers of Snowdrops (and who is not a lover of Snowdrops?) may cover three out of the four quarters of the year with their

favourites, and only be without them when there is quite a glut of other flowers. Old friends turn up here in multitudes, though I miss a good many of those which I have known before. Onosma albo-roseum, Omphalodes Luciliæ, Polygonum spherostachyum, Arnebia echioides, Pelargonium Endlicherianum, Primulas without number; Aubrietias, and such like plants abound on every hand. There is an Aubrietia which I want some day to see in blossom very much, for it is called the Beauty of Badeu; and if it be that, what a beauty it must be? And this Beauty of Baden has almost entirely refused to yield any seed at all. But Max Leichtlin has conquered it; and from one single seed which he espied he has raised a plant which has a very curious look about it, and is certainly very different from its parent. It has not had time to blossom as yet, but who can say what it will be?

I wish I had time to spare, and could linger on here for month after month. What might not one learn under such conditions as are found here? and with such a master as this? How I learnt that he could do nothing with one plant till he kept it cool by covering the ground with Polygonum vaccinifolium, and then all the trouble disappeared. How another (Iris Hartwegii, which has also bothered me till now must be moved at one season of the year, and only at that one; how this difficulty may be met and that triumph may be secured can be learnt only here, so far as I know. I said to my friend as he was guiding me over his terraces and pouring out experience as he only cau do it-" I wish to goodness you would write a book and let the world a little more into your wonderful secrets." Hisanswer was: "I am only an apprentice." I thought to myself I should be quite satisfied to be an apprentice to an apprentice if I could only get to know the tithe of what you know, and could apply my knowledge as well. Henry Ewbank.

NEW OR NOTEWORTHY PLANTS.

ACALYPHA SANDERI, N. E. Brown (n. sp.)

THIS is a very beautiful species of Acalypha, quite distinct from any other at present in cultivation. Most, if not all, of those that are cultivated are grown for their foliage, but the charm of this novelty resides in its long, drooping, female flower spikes, which are dense and bushy, like a squirrel's tail on a small scale, and of a beautiful, bright, rose-madder colour. effectively contrasting with the uniform bright green of the leaves. Undoubtedly it is a very distinct and attractive plant, and will probably prove to be one of the most striking novelties of next season. It was discovered growing near the sea in the Bismarck Archipelago, by Mr. Micholitz, when collecting in that region for Mr. Sander. Mr. Micholitz states that it is a sun-loving shrub of strong growth, very floriferous, and that the beautiful flower spikes last a long time in perfection. At his request I have great pleasure in attaching to the plant Mr. Sander's name. The following are its botanical characteristics.

A vigorous shrub, attaining a height of 10 to 15 feet. Leaves spreading, with pubescent petioles, 2 to 2½ inches long, and blades 5 to 5½ inches long, 3 to 3½ inches broad, ovate, acute, or shortly acuminate, rounded at the base and emarginate at the insertion of the petiole; the margin variably serrate, with obtuse teeth, that are large or small, or sometimes almost wanting on the basal half of the leaf; upper surface bright green and sparsely hairy, under surface paler green and nearly glabrous, except along the midrib and base of the principal nerves, which are more or less pubescent. Male flowers not seen. Female flowerspikes axillary, densely many flowered, drooping, the

peduncle \$\frac{3}{2}\$ to \$1\frac{1}{2}\$ inch long, the flowering part 4 to 8 inches long, and \$\frac{1}{2}\$ inch in diameter when fresh. Braets minute, scarcely half a line long, ovate-acute, bearing clusters of three to five sessile flowers in their axils. Bracteoles very minute. Perianth segments half a line long, ovate-acute, green, ciliate, with white hairs. Ovary half a line in diameter, globose trigonous, green, densely covered with stiff white hairs. Styles three, divided to their base into numerons long, filiform stigmas, of a bright rose-madder colour, drying brown. Native of the Bismarck Archipelago.

Possibly the plant is dioccious, as, so far as I am aware, only female flower-spikes appear to have been produced on the introduced plants, the stock of which is in the hands of Messrs. F. Sander & Co. N. E. Brown.

Lemo-Cattleya × Schilleriana, Schofield's variety (new var.).

This is one of the most beautiful of the race of hybrids resulting from the natural hybridisation of Lælia purpurata and Cattleya intermedia which I have seen. By far the greater part of the L.-C. × Schilleriana in gardens appear to have come from C. intermedia hybridised with L. purpurata, but like the variety figured in the Sclect. Orch., i., t. 6, as Lælia gigantea, whose first flowers I had the pleasure of seeing, this one is without doubt from Lælia purpurata and Cattleya intermedia. Indeed, it might be described as approaching closely to L. purpurata in size and showiness, but with a change of form, mostly observable in the labellum, wrought by the influence of the other parent.

The flower is much broader in the petals than ordinary varieties, and the gorgeously-coloured lip is fine in form, and surpasses that of any other variety which I have yet seen. The sepals and petals, which are each about 31 inches in length, are silvery-white tinged and veined towards the edges with pale rose. The nearly-circular front lobe of the lip is close on 2 inches broad, and of a rich blending of violet, ruby-red, and crimson, colours which also appear on the extended side-lobes, but on which they fade off to a purplish lilac tint both inside and outside of the upper edge. A broad band of deep purple colour marks the centre of the lip, with primroso-yellow, changing to white at the sides. It flowered with G. W. Law-Schofield, Esq., New-Hall-Hey, Rawtenstall, Manchester (gr., Mr. Shill), and as the plant is a very weak one, it may be expected to improve James O' Brien.

METHODS OF PROPAGATION,

(Continued from p. 331.)

TRAINING. - The fan-like form of training is the only one used for Peaches, Nectarines, and Apricots, and for most kinds of Plums in this country. As the name implies, in such trees the branches radiate from a common centre, and are formed by heading back the maiden fruit tree close to the bud or graft, and when fresh shoots are formed, training them into their places by means of wooden frames made of stakes firmly inserted in the soil, so as to make a diagonal pattern, like some light temporary fence. To these stakes the shoots are tied with raffia. As the natural tendency of a tree is to grow upwards in a line from the root, and carry all the strength into this central stem, the trainer has to keep his lower branches very low indeed, if possible, at right angles to the axis of his tree, letting the others follow upwards and outwards, till the tree is finished, but avoiding a central stem used in horizontal work. By this method the danger of crowding is obviated, and the sun and air are able to reach every portion of it, which is necessary to the ripening of the wood, and therefore to fruitfulness.

Bush and Pyramidal Forms.—The training of trees to occupy positions in the orchard and garden, independent of the support of a wall or fence, is much more simple, and the pruning-knife is the sole aid, upon the judicious use of which depends the formation of the required tree. Taking a maiden tree which may have been obtained from bud or graft, wo will proceed to make a "bush" tree of it. If from

a bud, it will probably have but one shoot; this must be headed back to three or four eyes, which will soon burst into growth, and should then be prevented from growing towards the centre, and from crossing cach other, the object being to form an open or bowl-shaped tree. When the laterals have grown from 2 to 3 feet, and are partially ripe, they must be stopped, in order to induce them to throw short spurs, such as may eventually produce fruit. Let the operator, however, secure an outside bud to terminate the shortened shoot, as this will serve to keep open the young tree, and prevent branch crowding. This kind of tree is used very largely by fruit-growers in the suburbs of London and other large towns, where they

this period of growth, so that the purchaser may finish the work in his own garden. There is too great a tendency now to demand a finished tree, called in the catalogues a fruiting tree, and ourserymen, therefore, sell many trees which have already fruited in the nursery, but this practice is not the best for the future well-doing of the tree, and skilled gardeners prefer young trees.

Standard Trees are obtained from the nurseries generally when they are three or four years old, and are formed by encouraging the growth of one central shoot, forming eventually the bole, but the height from the ground-line to the branches varies in different counties; in Kent it is 5½ to 6 feet, while in

FIG. 71.—ACIDANTHERA BICOLOR: FLOWERS WHITE, WITH A PURPLE-COLOURED BLOTCH.

allow a crop of Beet, Turnips, or even Potatos, between the trees; while in rural fruit-growing districts, bush-fruits and Strawberries are generally grown between the rows of permanent standard trees, until the latter become so large as to require all the room.

Pyramids are formed, on the other hand, with a central shoot, from which shoots should extend outwards all round, making the foundation of the tree. This is achieved by heading back the central axis or shoot, and encouraging the formation of lateral ones, the uppermost being trained to secure the upward growth of the tree; while by leaving the terminal bud on the right of the tree one year, and the next one on the left, a comparatively erect central bole is secured. Nurserymen, as a rule, do not further train pyramids, preferring to sell them at

the midlands and north 5 feet is the maximum. When the required altitude is reached, the shoot is stopped or headed back; this excites the dormant buds, and three or four of them are allowed to grow freely, forming the head, while those below are permitted to remain for the purpose of thickening the bole, being generally stopped to two or three leaves. These spurs are not removed until the tree is thick enough to stand without a stake, or until the tree is sold. Modifications have been made of the standard form of training by a well-known Kent firm, and so amateur's standards are obtained. These are simply standard fruits on dwarfing stocks-Apples on the Paradise stock, Pears on the Quince stock, and Plums on the Myrabelle and Sloe, and perhaps Cherrics on the Nahaleb.

Instead of these being kept short by early pinching and pruning, they are encouraged to run up standard high; and the laterals, which are almost always produced by trees on these stocks, are pruned back to two or three bnds, as is done in the formation of cordon trees. It follows, therefore, that fruiting spurs are formed the whole length of the stem or bole, and later, there is a good fruitful head in abilition. Probably this form of tree will become very popular with amateurs who have small gurdens. The necessary after-treatment of standard or amateur standard trees is to plant carefully, avoiding deep planting, unless in very light soils, and to make the trees thoroughly secure against wind by staking. Plant as early in the autumn as you can, even if a few leaves still hold on to the branches, and the following spring cut back each shoot to three or four buds, and just above an outside bud. By such treatment the head will be kept open, which is very essential in all fruit trees, especially those standard trained.

After planting, give a liberal mulching of partially-decayed dung, that from the cow-yard being preferable, and let it remain all the winter. In the spring just fork it under the soil, but avoid disturbing the roots in doing so.

There are many other methods of training used, especially on the Continent, which one English firm has endeavoured to make popular in England. However, most gardeners have quite enough to do without engaging in "fancy-work," which I as one of the old school must call these methods of training. Experience.

(To be continued)

ACIDANTHERA BICOLOR.

This is a pretty member of the Iridacew, from the more mountainous parts of Abyssinia and the Zambezi country. It was described by Hochst, in Regensh, Flora. 1844, p. 25, but until a few years ago, corms appear never to have been introduced into this country, although the plant has been cultivated to some extent in America. It flowered at Kew, we believe, in 1892, and this was no doubt the first time in England. The globose corm is from \(\frac{1}{2} \) to 1 inch in diameter, and enveloped with fibres, and the foliage resembles that of the less robust section of Gladiolus. The stem of the flowers shown in fig. 71 were about 15 inches long. but they would become longer if cultivated in a greenhouse. Each spray bears from four to six widely-expanded flowers. The perianth tube is creamy-white and slender, and about 4 inches long. It is divided into six oblong acute segments, which, in the specimen figured, were 14 inch long and 4 inch broad in the centre. The five lower segments are stained with blotches of purple at the base, from which the almost erect one at the apex is free.

Messrs, Veitch & Sons, Chelsea, who exhibited flowers at the last meeting of the Royal Horticultural Society at the Drill Hall, when a First-class Certificate was awarded the plant, inform us that A. bicolor is hardy at Coombe Wood, and in similarly sheltered places it will be a useful and pretty addition to this class of bulbons flowering plants. In most situations, however, it will be likely to succeed if the corms be lifted and stored during the winter, and in spring planted-out in a warm border. It would be valuable also in a cold greenhouse in 8 or 9-inch pots, which would contain several corms, and consequently a considerable number of pretty and sweet scented

FOREIGN CORRESPONDENCE.

BEGONIAS AT FERRIÉRES.

The collection of tuberous-rooted Begonias at Ferrières includes the best French varieties up to date. In the middle of September the plants were at their best, and the flowers equalled in size a good Camellia bloom. It may be worth while to name a few of the finest as a guide to readers of the Gardeners' Chronicle, who may desire to add to their collection some of the best continental varieties. I will mame the

best first, and the rest in order according to their merit. Albert Crousse is a very compact growing plant, flowers abundant, double, pink, each bloom measures 5 or 6 inches across, and by far the best of all; Camille Flammarian is very vigorous in habit, flowers double, very large, and peduncles rather long, colour of flowers salmon-pink; Doctor Feltz is a vigorous grower, flowers double, colour rich bright red, but darker in the centre of the flower; Amitié is a rose-coloured one and double; Triomphe de Nancy has immense double flowers, these are straw-coloured and very attractive; Normandie grows vigorously, and has a fine appearance, the flowers are double and very large, colour pink ; Gloire d'Echouché has extra large dense flowers of a pale pink hue. The single flowering varieties are also of great merit, and some of the flowers from plants raised from seeds this season measure 18 centimètres (7 inches) across, and the colours are very fine. Great care is taken each season when fertilising the flowers to keep together those of the same shade of colour. The seed was sown in heat about the end of January. They were pricked-out, and afterwards planted in frames in April, and were planted in their present position about a foot apart towards the end of June. A. C. C.

THE WHEAT CROP OF 1896.

To find a harvest which began as early as the present one, we must go back to the year 1868, a period of twenty-eight years. In 1868 we began to cut our Wheat on the 14th of July, this year we commenced on the 18th, our usual time on this farm for beginning harvest being about the middle of the first week in August. There is a considerable agreement between the Wheat crops of these two remarkable years, which I shall refer to later on. After an exceedingly hot and dry September, October began with a heavy rainfall during the first fortnight, 2 inches having been measured the last two weeks; and the first three days of November being fairly dry. The first week in October was hot, the remainder of the month was cold; altogether the weather was very suitable for the sowing of Wheat, and the seed was got in under very favourable conditions. November was a very warm month with a good deal of rain; December was cold with about an average fall of rain. From the beginning of January to nearly the end of February, the weather was unusually warm, and also very dry. March was a very warm month, a good deal of rain fell during the first week, some in the second week, and in the third week nearly 2 inches fell. Except upon light land, no spring corn could be sown during this menth. April was warm, and although more or less rain fell every week, the quantity was but small. At this period. when the Wheat began its active growth, its appearance was highly favourable, the great fear was that it was in too luxuriant a state to hear much rain. Fortunately the month of May, which was both hot and very dry, and consequently suitable to the Wheat, quite destroyed the prospects of the hay crop. June was a very hot month, with an excess of rain during the first half, and a deficiency during the last two weeks. There was some excess of temperature in July, with a deficiency of rain, and as the weather did not break up until after the middle of August, the crop was secured in excellent condition in most of the great Wheat-growing districts. Altogether, the season from beginning to end may be considered to be highly favourable for the Wheat; a good seed-hed, a warm and dry winter, and a hot and dry summer, while the rainfall in June, chiefly in the early part, which amounted to 21 inches, was a great benefit to the Wheat, preventing the grain from ripening too rapidly, and giving us a crop which, for quantity and quality combined, has rarely been exceeded. Although the rainfall during this harvest year, beginning with October and ending the middle of August, was considerably deficient, but we have already more than made up the deficiency, no less than $7\frac{1}{3}$ inches having fallen during the last five weeks.

The following table shows, in the usual form, the produce of Wheat on the selected plets in the experimental field at Rothamsted for 1896, which is the

fifty-third year of the successive growth of the crop on the same laud. It also gives, for comparison, the average produce of the same plots over ten, thirty-four, and forty-four years, 1852 to 1895 inclusive:—

TOTAL STRAW, CHAFF, &C., PER ACRE, CWTS.

- (1) Equal to $35\frac{1}{4}$ bushels at 60 lb. per bushel.
- (2) Equal to 294 bushels at 60 lb. per bushel.
 (3) Equal to 27 bushels at 60 lb. per bushel.
- (1) Equal to 271 bushels at 6) lb per bushel.

The permanently-unmanured plot gives a yield of 163 bushels per acre, which is very much over the average yield of ten, thirty-four, or forty-four years. The farmyard dung, and the three artificially-manured plots all give a high yield. It is in regard to the quality of the Wheat, as shown by the weight per bushel, that this crop gives such favourable results. In two instances the weight of the bushel reaches 64 lb., and on referring back to our results since they began in 1844, I find no record of a weight of 61 lb. in any one of these five experiments. Our crop being threshed so soon after it has been harvested, would show a lower weight per bushel than if it had been allowed to remain in the stack some months. For so dry a year the amount of straw is large, being at the rate of nearly one cwt. for each bushel of Wheat, In 1895, when we had a good yield of Wheat, the straw was very short-but straw is, at the present time, a very important item in a Wheat-Taking it altogether, farmers may be congratulated in having obtained so good a crop of Wheat. In The Times of August 17, 1868, I gave the results of our Wheat-crop of that year, the table of results being similar in all respects to the table of this year. The harvest commerced on July 14several days earlier than the harvest of the present The temperature of July, 1868, was considerably higher than that of 1896; the records of the Royal Observatory at Greenwich, give for July twenty days, when the temperature reached 80° (Fahr.), five days in which it reached 90° (Fahr.), and one day on which it exceeded 96° (Fahr.). Tho Wheat of that year ripened too fast, and was not in quality equal to the Wheat of the present year; still, there is a considerable similitude between the crops of the two years. The permanently-unmanured land yielded, iu 1868, $16\frac{5}{8}$ bushels per acre; and in 1896, 163 bushels. The highest artificial manure gave, in 1868, $46\frac{1}{2}$ bushels; and in 1896, $44\frac{1}{8}$ bushels; while the mean of all the plots in 1868, calculated at 60 lb., gavo 34\(\frac{5}{2}\); and in 1896, 35\(\frac{1}{4}\) bushels. It is rather remarkable that, after the removal of twentyeight crops of Wheat upon the same field, to find so close an agreement in two crops grown under somewhat similar climatic conditions. At the weight per bushel of 631 lb., the mean of our plots gives a

produce of 333 bushels per acre; and if we adopt the standard weight of 60 lb., the produce would be 351 bushels per acre. On account of the very high weight of the British grain this year, it makes very little difference in the available crop of the country, whether we adopt as the average yield 331 bushels at 631 lb., or 351 bushels at 60 lb., the difference calculated one way or the other in the crop of the country would not amount to much more than one-third of a million quarters. In all our estimates of the acreage yields of our crops, a bushel is our standard, whatever may be the weight of corn it contains. In adopting the government weight of 60 lb. per bushel, in good seasons like the present, our acreage yield must always appear too high, as it is quite certain that the crop of the country does not amount to thirty-five bushels per acre.

Taking the average population of the United Kingdom over the harvest year ending August 31, 1897, as rather over 39½ millions, at six bushels per head, our requirement to feed then would amount to nearly 30 million quarters of Wheat. Of this we may say our home produce will supply rather more than 7 million, leaving nearly 23 million to be supplied by imports. Last year we imported 22½ million quarters of Wheat and Wheat-flour as Wheat, and it is said that we reduced the stocks of foreign Wheat in warehouse to the amount of 2 million quarters. Owing to the very high quality of our crop of this year, it is quite probable that a much larger portion than usual will be sold as bread corn.

Iu 1894-95 we imported over 3 milliou quarters of Wheat beyond our requirements, the consequence of which was a considerable fall in price, and a large accumulation of stocks in the warehouses. Most of this has now been used up, and should the imports in future not exceed our requirements, we may expect that prices will improve. So long as Great Britain is the only market for the surplus Wheat of the world, we must expect that prices will go down, until it does not pay a nation to grow Wheat for export, and it would almost appear that this point had already been approached in some countries, if we may judge from the decline in their exports. Sir J. B. Lawes, Rothumstel, Sept. 24.

KEW NOTES.

KENDRICKIA WALKERI.-Although described by Dr. Thwaites as one of the most beautiful of Ceylon plants, it is only recently that this scandent Melastomad has been successfully introduced into English gardens, a batch having been raised at Kew from seeds received two years ago from the Ceylon Botanic Gardens. Some of these seedlings have lately been distributed in England and elsewhere. It is described by Sir Joseph Hooker as a climber, ascending to the top of the highest trees, and when in blossom tinging the forest red. The stems creep up the trees like Ivy does, by means of numerous aërial roots; the leaves are opposite with short petioles, and ovate or oblong blades 11 inch long, fleshy, the margins clothed with glandular hairs, and the surface with whitish dots, as in some Senerilas. The arrangement of the leaves and habit of the stems change when they reach the summits of the trees, comewhat analogous to the change observed in Ivy, when it can no longer climb higher. The flowers are large, and are borne in terminal umbels; calyx urn-shaped, rose-purple; petals, four, fleshy, nearly an inch long, coloured bright red. The plants at Kew have grown freely, but they are as yet only in the climbing stage. Kendrickia is a monotypic genus, confined to Ceylon, and, in botanical relationship, not far removed from Melastoma.

KICKXIA AFRICANA.

A description of this new African rubber-tree, together with figure and particulars as to its economic value, were published in the *Kew Bulletin* last year, p. 241. Seeds of it have since been received from Lagos, and from these a batch of plauts has been raised at Kew, some of which have already been distributed to the Colonies and India. The tree is wild and apparently abundant in some parts of west tropical Africa, and it is described as one of the most beau-

tiful trees in the forests of Lagos, where it forms straight, smooth stems, 60 feet high, averaging 12 inches to 14 inches in diameter. Each tree yields from 10 to 15 lb. of rubber, which is obtained by tapping the trunk in the rainy season. The raw rubber has been valued in Eugland at 2s. to 3s. per lb. Judging by the behaviour of the young plants at Kew, this tree grows very rapidly, and as the rubber obtained from it is of considerable commercial value, its distribution from Kew to our Colonies and India is likely to be productive of good results in years to come. According to information given in the Kew Bulletin for March and April last (on p. 76), the

are insipid. The Kew plant grows in a shallow bed of rich soil in a sunny position along with Coffectrees and the Champaca Michelia Champaca). It ripens seeds, from which plants are readily raised, and these grow to fruiting-size in about four years.

DIOSPYROS KAKI

is again fruiting freely in the Succellent-house at Kew. Evidently this plant is easily managed if treated similarly to the Camellia, but affording it all the sunlight and air possible during the summer. The fruits are as large as middle-sized Peaches, bright scarlet when ripe, and if eaten when the pulp is soft

Fig. 72.—RANDIA MACULATA: FLOWERS COLOURED PURPLE AND WHITE. (As growing in the Royal Botunic Gardens, Edinburgh.)

total exports of this rubber from Lagos last year amounted to over 5,000,000 lb., of the value of nearly £270,000.

EUOENIA MALACCENSIS.

The Malay Apple, Jambosa malaceensis of gardens is a handsome stove shrub when grown as at Kew. where, in the Palm-house, it has attained a height of 12 feet. The plant, as seen at Kew, is abundantly branched, and furnished with large, oblong, glossy green leaves. It flowers two or three times a year, and each time the crimson blooms are succeeded by crimson-coloured egg-shaped fruits, 3 inches long, which have a soft, juicy, edible pulp. According to Sir Joseph Hooker, there are many varieties cultivated in different parts of the tropics for the sake of the fruits. Here it is an ornamental plant rather than for its edible fruits that it deserves cultivation, both flowers and fruits being attractive. In this country the fruits

they are decidedly palatable. The Kew plant is about 6 feet high, with sturdy branches, and ovate, leathery glossy-green leaves, as large as a man's hand. It is planted in a bed of gravelly soil, and receives a mulch of cow-manure every year, in the spring. The fruits remain upon the plant a month or more after they are coloured, and are very ornamental. I wonder if Mr. Rivers has ever tried this plant in pots, like other fruits? The fruits of the Kaki, or Japanese Date Plum, are grown in the south of Europe for the Paris market, where I am told they realise what may be called fancy prices.

PASSIFLORA EDULIS.

This is a variable species, and some of the forms are less fructiferous than others, although all appear to flower freely. One variety in the Water Lilyhouse at Kew has flowers almost as large again as the type, and the corona-rays are of a bright purple

colour: the leaves also differ from the ordinary form in being larger and less uniformly lobed. It is worth including among stove-flowering climbers. The free-fruiting variety has been, and is still bearing a good crop of egg-shaped, purple fruits. The species is grown here and there chiefly as an ornamental plant, but it is worth more attention as a fruit-producing plant of easy culture, the pulp of the fruit being so deliciously flavoured that it might be used in a variety of ways for flavouring. It is known as the Mountain Sweet Cup. P. laurifolia, the Water Lemon, with orange-yellow fruits; and P. mali formis, the Sweet Cup, with ovate acuminate leaves, and green and yellow fruits, are two other species which find favour in some tropical countries on account of their delicious fruits, but although they grow well and flower at Kew, I have never seen them in fruit.

THE COTTON PLANT,

when properly grown, is not without attractions as a stove shrub. A group of plants in the Palm-house, and another in the Succulent-house, at Kew, are now flowering and seeding freely. The plants are 4 feet high, furnished with short horizontal branches, and palmately-lobed, hairy leaves; the flowers are like those of Hibiseus, cupped, cream-yellow, and 2 inches long; the pods containing the seeds, enveloped in cotton, are egg-shaped, 2 inches long, when mature hard, and green, finally bursting and displaying the cotton enveloping the seeds. The Kew plants are all forms of Gossypium herbaceum, which furnishes the varieties cultivated in India, known as Indian Cottons. G. barbadense being the source of the varieties known as the American Cottons. The seeds were sown at Kew in March, and raised in a tropical house; the plants are potted on as they require it, the final shift being into 8-inch pots. They were grown in a moist warm-house, as near the glass as possible, and are allowed plenty of sunlight. They require careful watering, anything like excess causing them to turn yellow, and the tower-bul-t to drop off before opening. Fresh plants are raised each year. W. W.

RANDIA MACULATA.

This showy plant belongs to the Natural Order Cinchonacce, named in honour of Isaac Raud, formerly Praefectus of the Botanic Garden of the Society of Apothecaries, at Chelsea. The genus consists of about ninety species of creet or climbing shrubs, inhabiting the tropical parts of Africa and Asia.

inhabiting the tropical parts of Africa and Asia.

The species depicted in our illustration (fig. 72), and botter known in gardens as Gardenia Stanleyana, is figured under that name in the Botanical Magazine, t. 4185. The flowers, very fragrant, consist of an extremely long slender tube, cylindrical, dark purple in colour, dilated above, and opening into a bell-shaped mouth; the limb, of five broadly-ovate, spreading obtuse segments, is purple and white without, pure white within, and is covered (except at the margin) with oblong dots of a deep purple hue. The flowers are produced singly from the forks of the branches, and when fully grown are about 9 inches long, but several months intervene between the time of their first appearing and their full development. The leaves are spreading, subcoriaceous, oblong, and set on short petioles, and quite entire. A plant was exhibited, from Kew, at a meeting of the Horticultural Society of London, in March, 1845. (Soe Gardeners' Chronicle, March 8 of that year, p. 152.)

Although like Gardenias, of easy cultivation in a stove, Randia maculata is a plant which is seldom seen outside of botanical gardens; and the illustration of an example of it about 7 feet in height which we now afford our readers, came from the Royal Botanic Gardens, Edinburgh.

THE APPLEY TOWERS GRAPES.

Lady Hutt and Appley Towers Grapes raised by Mr. Myles a good many years ago, at Appley Towers, Isle of Wight, are seldom seen in good form, but we may hope to inspect good sample bunches soon, and amongst others, Mr. Bowerman, gardener at Hackwood Park, Hants, has them. The first-named variety is a superb-looking Grape, the latter not so large this year, but the Vine is likely to throw better ones another year. The variety was worked on a Vine Muscat of Alexandria two years last spring, consequently it has made three annual growths, and the rod has reached the

top of the house. It carries six bunches, which average three pounds weight each, of handsome form, though oddly each has a shoulder. This leads to the inference that the single shouldering is characteristic of the variety. The berries are large, rounded, and clear in colour, indeed the bunches almost look like white Alicantes, and they need two or three weeks' more time to finish. How far they will do that has yet to be seen. If, however, they presently put on an amber tint they will be attractive. In a class for any other white, Lady Hutt, when well grown, should be a strong feature. The Appley Towers Vine is less vigorous, but it carries several handsome bunches, which somewhat resemble Gros Maroc in form of berry. They are colouring well. It is hoped that these Isle of Wight-raised-Grapes, the products of a single "berry," will justify their so far good reputation, and become worthy of wider cultivation. A. D.

THE CURRANT PLANTATIONS AROUND PATRAS.

On August 15 a friend and myself started from Athens on a visit to Patras to see the Currant harvest. We left Athens at 4 o'clock in the morning, riding to Corinth on our bicycles, being 25 kilomètres on our way before the sun rose. After sunrise we made all speed towards Corinth, at which town we arrived at 10 a.m. Some very fine scenery was passed on the way, especially where the road winds along the side of a precipice, on one side of which is a sheer descent into the sea, and on the other a steep acclivity several hundred feet high, clothed with Pines to the top. Higher up the side of the precipice, on a similar ledge, the railway from Athens to Corinth winds, both highroad and railway being good specimens of modern engineering.

On arriving at Corinth we found that the road went only a short way beyond the town, and there was no road to Patras; as the train was leaving for Patras in thirty minutes, we decided to travel the remainder of the way by rail. Soon after leaving Corinth, one is in the midst of the vineyards, whose produce being mostly of a small, white kind, are dried. The railway skirts the sides of the mountains, which are broken by narrow ravines, the sides of which are clothed with tangled masses of wild Olives, evergreen and prickly Oaks, Oleanders, Arbutus Unedo, tall-growing Ericas, and various dwarf-growing trees, with a few Pines, all matted together with Smilax aspera, wild Vines, Clematis orientalis, C. vitalba, an Asparagus, In places where the mountains drop and form low hills, or where there is a piece of level ground between the base of the mountains and the sea, Olives and Lemon-groves, mingled with patches of Vines, come right down to the seashore.

At .Egion, about 100 kilomètres from Corinth, the mountains recede from the sea, leaving a broad belt of gently-sloping ground, and at once a plunge is made into the Currant-vineyards, which continue onwards to Patras itself, and round the coast for many miles; the peasants were busy gathering the fruit, and laying it in the sun to dry, forming a very interesting scene in their white dresses amongst the dark green of the Vines.

We arrived at Patras about 1 P.M., and stayed there the night, in the morning riding out to Rion, a few kilomètres out of Patras. It is from here, and also from .Egion, that the best Currants are supposed to come. On arriving at Rion we went to the house of General Hadjyannis, a large cultivator, owning much land, who gave us a cordial welcome.

The Vines planted consist of canes of the previous year's growth, and these when trimmed are put into trenches about 1 foot wide and 2 feet long, dug at a distance of from 3 to 3½ feet apart cach way, varying in depth from 1 foot near the seashore, where there is plenty of moisture, to 2½ or even 3 feet on the slopes at the foot of the mountains, where the Vines require watering by irrigation, but which is not necessary near the seashore. When planting the canes, the men give them a slight twist to split them in places, as they say the canes then root more readily. The base of the cane is then placed at one end of the narrow trench, laid along the bottom, and brought to

the surface at the other end of the trench. This is to get as much rooting surface below-ground as possible. The trench is then filled in and the soil well trodden, and the top of the cane is then cut back to two or three eyes above the surface of the ground. Planting may be done at any time between the fall of the leaf and the beginning or middle of March (Greek style, which is twelve days behind our calendar); still, the end of January, February, and the beginning of March is considered the best time for planting. The young Vines do not make much growth the first year, and do not produce fruit till the third year.

As soon as the leaves on fruiting Vines have fallen, the canes are cut down to within I foot of the old wood, and the Vine is then cut round through the bark with a saw near the surface of the ground. I cannot quite understand the exact influence this has on the Vine, but that it affects the commercial value of the Vines will be seen from the following :-One season General Hadjyannis had a plot of Vines left uncut, and the results, to say the least of it, were not very gratifying, as the year before the experiment this plot yielded 12.000 lb. of dried fruit, whereas the year of the experiment, when the fruit was gathered, this plot only yielded 1500 lb, of dried fruit. The following year, on returning to the old system of cutting through the bark with the saw, the yield was 6000 lb., and in the following years the crop was up to the average. After the bark has been cut, the soil from between the rows is drawn up around the Vines in something the same style as Potatos are earthed-up in England, this being to loosen the surface, and allow the water to penetrate more readily to the roots of the Vines. The Vines have to be watered by irrigation, where there is not sufficient surfacemoisture. In the month of March the Vines receive the final pruning, being cut back to two or three eyes.

When the buds begin to swell, the ground is dug over and levelled, the Vines receiving no more water until the following winter, except, of course, what they may receive from an occasional shower. Vines now require very little attention until the tlowering stage, when they are carefully gone over, and each bunch dusted with flowers-of-sulphur to prevent mildew; of course, should the spring be wet and cold, a close look-out is kept in case of mildew appearing on the foliage, which, if it made any headway, would destroy the season's crop. The only other disease they are troubled with at Rion appears about the time the fruit is turning colour; it commences as a small black spot on the berry, and soon after this appears the berry shrivels up and falls off. On examining some berries infected with it, I found them to be full of a dark brown dust, which led me to think that the disease is caused by some kind of fungus. The berries examined were ordinary Grapes, the Currant-grape not being so liable to the disease. Sometimes this disease does not appear for several

In the month of August the fruit is ripe and ready for picking; after being cut it is carried by mules and donkeys to the drying-grounds near the house, where it is spread out to dry on a prepared sloping piece of ground plastered with cow-dung. The reason this is used is because it dries and forms a clean surface, free from cracks and dust. General Hadjyannis told me that he and most of the large growers use large wooden trays shaped something like hand barrows, to lay the fruit on, in preference to the sloping banks of soil, because, in case of rain coming on during the drying time, they are more convenient, as they can be stacked one above the other, and covered with a tarpaulin; whereas on the ground the rain is liable to penetrate to the fruit and spoil it, even when covered.

Drying the fruit takes from nine to fifteen days, according to the state of the weather. When dry the fruit leaves the stalk very readily, all of it is picked over by hand and the larger stalks removed; it is then placed in small winnowing machines worked by hand, which separate the good fruit from the bad, and clean out the smaller stalks. The fruit is then the familiar Currant, known to everyone; it is now packed in the boxes as seen in the shops at home, and is then quite ready for export. The boxes in which the Currants are packed are chiefly made in

Patras, the manufacture giving employment to a large number of men.

After a very pleasant day we returned to Patras, staying there the night, spending the next day in looking round the town, which is pleasantly situated at the foot of the mountains. We paid a visit to some of the Currant plantations on the other side of the town from Rion, on the road to the ancient Olympus. On making enquiries we were told that the crop this year is well up to the average, but rather late on account of the backward spring.

We left Patras at 8 PM. on Monday, by steamer, going up the Gulf of Corinth, passing through the Corinth Canal into the Gulf of Ægina. arriving at Pireus, the port for Athens, at 6 A.M., well pleased with our visit to Patras; the green vineyards and wooded mountain slopes being a pleasant change to the country around Athens, which is very arid and barren-looking at this time of the year. Thos. Honey, Ruc Kijissia, Athens.

FLORISTS' FLOWERS.

CULTURAL NOTES ON CHRYSANTHEMUMS

No time ought to be lost in placing the bulk of the plants intended for the production of large blooms under cover. Many gardeners think that the plants by being left out of doors two or three weeks after the petals become visible, are retarded in their development; but this is mistaken practice, for when the calvx has burst, it is useless to think of checking the further expansion of the blooms. Much better then, when the flowers have reached this stage, to place the plants under glass, and allow them to flower. Much of the damping of blooms complained of in some seasons is traceable to the plants being kept outside too late after the florets have began to unfold. Early removal from outside is a very good way of hastening on such plants as have set their bads a little too late to admit of the blooms being in perfection on a given date. The locality, too, in which a grower is situated has to be considered; if it be lowlying, and probably damp, early removal to a glasshouse is necessary, for the reason that early frosts are more to be feared than in high, and consequently drier, places. Before housing, every plant should be rendered quite clean, and free from every kind of insect. Let no mildewed example be housed with clean ones. as, under the conditions prevailing in a house, the fungus is sure to spread, and work much mischief. As a cure for mildew, thoroughly wet every leaf on both sides with the flowers of sulphur and quicklime mixture, so often recommended in these pages. For the information of new readers. I will repeat it here. Place 2 lb, of sulphur and 2 lb, of quicklime in 10 quarts of water, and boil for twenty minutes. For syringing on the plants use two wine-glassfuls of the mixture to four gallons of clean cold-water. A syringe with the jet affixed causing a single stream is best for applying the liquid, as by placing the forefinger over the orifice the stream may be directed upwards and spread over the plant just as may be required. A light, airy, span-roofed honse is the hest structure in which to flower the plants; but owing to lack of such a house, the Chrysanthemums are placed beneath the shade of Vines and Peach-trees in forcing houses, or of climbing plants in the greenhouse or conservatory. Before the plants are housed, all surplus shoots should be removed from the Vines and Peach-trees, so as to admit as much light and air as possible, and the plants themselves should not be crowded together; and air should be afforded night and day. In what way the plants shall be arranged is a matter requiring a good deal of consideration. A sloping bank formed of them is a good one, both for observation, convenience of watering, and otherwise attending to the plants. If exhibiting is a point which has to be considered, it is prudent to arrange the Japanese varieties by themselves, as fire-heat may be necessary for these whilst the blooms are developing; besides, the flowers are improved, the colours brighter, and the florets come out clearer and more regularly than is the case in unheated houses. Place the plants as near to the glass as possible, as this will

prevent the footstalks of the blooms becoming drawn and weakly. Should the weather continue dry and warm after the plants are housed, alight syringing overhead, at least once daily, will do good. Extremes of drought, or of moisture in the air, as well as at the roots, do not favour fine blooms or healthy green foliage. Continue to administer plant-food steadily and regularly, but avoid the excessive use of any kind of stimulating food, the preservation of the roots in a vigorous condition being a point of much importance. It is seldom that a plant will require watering more than once a day, and not always so often, evaporation being slow at this season. Water should be applied only in the forenoon, and in damp or foggy weather the amount of air admitted should be less than in clear, bright weather, and the hot-water pipes should be kept warm day and night, the aim being the maintenance of a buoyant atmosphere in the house, and a steady temperature of 48° to 55°. Plants whose buds are late in developing should be stimulated with sulphate of ammonia, given in liquid form at the rate of half-an-ounce to one gallon of water. Green-fly attacks the expanding blooms, and must never be allowed to establish itself amongst the florets or on the leaves. An attack of green-fly, if not very severe or long-neglected, may be got rid of by fumigating the plants with nicotine in the form of XL All vaporiser or with tobacco-paper. and it is a good plan to fumigate the house twice or thrice on consecutive nights.

The plants growing against walls should now receive their final training; the recently-formed shouts being sufficiently long to be made secure to the wall, either by nails and shreds, or what is more simple, by a piece of wire run along in front of them and made fist here and there to the wall. E. Molyneux.

BOTANICAL ADDRESSES AT THE BRITISH ASSOCIATION.

(Concluded from p. 375)

The section met in the forenoon on Saturday, September 19, at the University College, Dr. Scott in the chair.

Dr. Gustav Mann communicated the results of experiments carried on by Miss Lily II. Hine on the changes in the tentacles of Drosera rotundifolia, produced by feeding with albumen, in the form of partially-boiled white of egg. Luntern-slides illustrating the changes observed at various intervals were exhibited.

Mr. D. Morris, assistant-director of the Royal Gardens, Kew, contributed a paper, which, in his absence, was read by Mr. Seward, on "The Singular Effect produced on certain Animals in the West Indies by Feeding on the Young Shoots, Leaves, Pods, and Seeds of the Wild Tamarind or Jumbai Plant (Leucaena glauca, Benth.)," The properties of this plant had received little or no attention in this country. It is commonly found along roadsides and in waste places in tropical America. The plant was much more plentiful in the Bahamas than in Jamaica; it was, in fact, distinctly encouraged in the former islands as a fodder plant. The people were fully aware of the singular effect it produced on horses. causing them to lose the hair from their manes and tails. It also affected mules and donkeys. Its effect on pigs was still more marked. These animals assumed a completely naked condition, and appeared without a single hair on their body. Horses hally affected by Jumbii were occasionally seen in the streets of Nassu, where they were known as "cigar-tails." Such dilapidated animals, although apparently healthy, were considerably de-preciated in value. They were said to recover when fed exclusively on corn and grass. The new hair was, however, of a different colour and texture, "so the animals were never quite the same." One animal was cited as having lost its hoofs as well, and in consequence it had to be kept in s'ings until they grew again and hardened. The effects of the Jumbai on horses, mules, donkeys, and pigs were regarded as accidental-due to neglect or ignorance. The plant was really encouraged to supply food for cattle, sheep,

and geats. The latter greedily devoured it, and were not perceptibly affected by it. It would be noticed that the animals affected were non-runinants, while those not affected were runinants. The probable explanation was that the runinants, by thoroughly mixing the food with saliva and slowly digesting it, were enabled to neutralise the action of the poison and escape injury. The seeds probably contained the deleterious principle in a greater degree than any other part of the plant.

Professor Trail, F.R.S., exhibited a number of floral diagrams of the Polygonacea, each one showing some variation in the arrangement of the floral organs.

On Monday the section met at University College, the chair being taken by the President, Dr. Scott.

Professor Bower, F.R.S., stated the result of his investigations into the number of spores contained in the sporangia of various types of Filicinese.

Professor Chodat, of Geneva, discussed the relationship of the various groups of green Alga, and illustrated his remarks by an elaborate series of black-board drawings. He dwelt especially on the variability of the thallus and modes of reproduction of such forms as Pleurococcus, Volvox, &c. He concluded with a review of the facts observed, and their importance in Jetermining whether or not there exists any affinity between these groups of Algae and the lower mosses and ferms.

Mr. W. H. Lang, M.B., B.Sc., give an account of some peculiar cases of apogamous reproduction in Ferns. From the results obtained from cultures of normal forms of Nephrodium Filix-mas, it appears that apogamy stands in no definite relation to cresting. Cultures of crested varieties of other species produced young plants of normal development at first, but after nine months apogamously-developed plants were produced in some cases. Possibly in these cases the prolonged cultivation of unfertilized probabli is a more important factor than the cresting of the parent plant.

The two last papers led to a discussion on the alternation of generations.

Professor Bower contended that the examples brought forward by Mr. Lang were abnormal, and as such not a fit subject for strict argument as to the origin of alternation.

Dr. Scott, in replying, said that the antithetic theory of the alternation of generations, if it meant anything, meant that a new generation, the sporophyte, was interpolated, and was not a modification of anything pre-existing. This view he protested against, and said there was no evidence to show that the two generations are distinct. He maintained that apogamy is reversionary. In some cases this mode of reproduction is more efficient than the normal method, and the number of cases in which it occurs is increasing.

Professors Magnus, Hartog, and Zacharias also criticised Professor Chodat's remarks.

In the afternoon, in the presence of the President, Sir J. Lister, Mr. Thiselton Dyer, F.R.S., director of the Royal Gardens, Kew, delivered a lecture on "The Geographical Distribution of Plants." He said that places where certain plants are found growing are not always places to which they belong, or the places which suit them best. Uniformity of climate and other conditions cannot account for the character of the vegetation in various parts. No flora is so widely distributed as that of the British Isles, and there is no species which is absolutely peculiar to the islands. The British flora is only a part of a larger flora extending over the northern part of the old world, and known as the flora of the palicarctic region. This region extends from the polar lauds to North Africa. In it the common character of the flora can be recognised, though in travelling from north to south the species change, The same difference in species occurs with change of altitude. Latitude and altitude are in this way interchangeable terms. The flora of the northern part of the new world is included in the nearetic region, which extends from the polar regions to Mexico. The trees of this region are like those characteristic of the palearctic region. The eastern European flora is not found, as would be expected, on the

eastern side of America, but on the western, and American plants are found growing in Japan. With regard to tropical flora, on the high lands of Africa plants common to Europe are to be found. The flora of Australia is probably one of the most ancient, and that of New Zealand is like it, but with striking omissions. The flora of both shows a remarkable likeness to that of the Andes. The general conclusion to be drawn from the distribution of the flora is that the species progress southwards with a greater divergence latitudinally. Extracts from the "Times."

COLONIAL NOTES.

TYPHOON IN HONG-KONG.

Typhoons are of frequent occurrence in Hong-Kong during the latter months of the summer. although it is selden that we get them of such violence as the one which visited us on July 29, The last one worth noticing was in October, 1894. but previous to that, there had not been a severe typhoon since 1874. The 1894 typhoon was very destructive, but the one this year appears to have been even more so. We first received tidings of it from the Spanish Consul here, who was informed of the same by cable from Manila on July 27, as follows .- "There is a depression to the E.N.E. of Manila, in the Pacific, not very far off the East of Luzon. On the following day the same gentleman kindly supplied the additional telegram from Manila: "The depression reported yesterday to the E.N.E. is a typhoon of great violence. It is now tearing across the north-east part of Luzon, and its course seems to be S.S.E. to N.N.W." The same day the Hong-Kong Observatory officials hoisted a red drum, indicating that the typoon was believed to be more than 300 miles cast of the colony. On this date the barometer read 29 61 at 4 p.m., and was still falling. The previous day's reading at the same hour was 29:66. The next day, the 29th, the following notice was issued from the Hong-Kong Observatory: "To-day, at 8.15 a m., the black drum (typhoon within 300 miles, and to the east of the colony) was hoisted. At 9.5 a.m. one gan was fired (strong gale expected). At 10.30 a.m. the typhoon centre appeared to be about 250 miles S.E. of Hong-Kong, moving in a N. N. W. direction. Strong N. E. to S. E. gale is expected here. The black south cone was hoisted at 10.30 A M." At 4 r.m. the barometer read 29:10, and the Observatory gun was fired at 5.45 P.M., indicating that a typhoon was expected here. Such were the warnings we had of the storm, and very timely they proved to When the gun is fired once, it is taken as the signal to make speedy preparations for a gale, Residents in the colony shut up their houses and bar all windows and doors. The captains of vessels in the harbour move their craft to safe anchorages. In the Botanic Gardens we were soon at work moving plants to sheltered positions, closing up houses, rolling up shading, and making everything secure that was likely to be damaged. By 5 r.m. we had done all that was possible to be done, and the only thing was to await the result. The following few items of the progress of the typhoon may be of interest: At 9 A.M. (on the 29th) the sky became overeast and the wind began to rise, with rain falling at intervals. The force of the wind kept increasing all day, so that by 6 P.M. a strong N.E. gale was blowing. After this it was increased to typhoon force, and between 9.30 r.m. and 10.30 r.m. it was blowing at the rate of 103 miles an hour as registered by the anemograph at the Hong-Kong Observatory Soon after midnight the violence of the wind began to abate, and by daylight the typhoon had passed to the west of the colony. The lowest reading of the barometer was 28.87. On the 30th a notice was issued from the Observatory saying that the centre of the typhoon had passed some distance to the South of Macao. The amount of damage done in the gardens is almost irreparable. It will take thirty years at any rate before they are in the condition they were before the typhoon. Should there be any more severe typhoons during that time, it is quite impossible to say when they will regain their

beauty. In the 1894 storm, many of the largest trees were blown down, and now a great many more have met with the same fate, about sixty altogether. This is not counting shrubs and herbaceous plants, many of which were blown clean out of the ground. Fortunately the typhoon was accompanied by very little rain, otherwise the damage would have been much greater. Trees and shrubs which have been left standing are in a mangled condition, the beauty and symmetry of most of them being entirely gone. Anyone going through the gardens at the present time could easily imagine that it was winter-time in England, as there is scarcely a leaf to be seen. An aviary in the gardens had its roof taken off, and most of the birds escaped. Outside of the gardens many large shade trees were uprooted, and much damage done to others. Houses were unroofed in all parts of the colony, and contractors will have a busy time of it for some months to come. In many instances chimneys were lifted off and dumped clean through the roof on to the bedroom floors. Much damage was done to shipping in the harbour, as several vessels dragged their anchors and collided with one another. It is said that one vessel alone will cost 7,000 dollars to put her in thorough repair again. As far as the police have been able to find out, upwards of fifty Chinese were drowned in the harbour through the capsizing of their boats; so that altogether the 1896 typhoon has left many traces behind which will be long remembered by the inhabitants of Hong-Kong. W., J. Tutcher.

CULTURAL MEMORANDA.

PHRYNIUM VARIEGATUM.

I find many growers have failed to do this plant satisfactorily this season. Being in a hurry to get the plants in early, they have been started before their usual time, and although at first the variegation has shown well, they have quite run out before they were large enough for use. The best way to ensure keeping this useful plant in good character is to take off the suckers or young shoots soon after they get above the ground. They may then be potted in some light sandy compost, and will soon start into growth again, and do not have time to get too vigorous. While plants frequently divided will retain their variegation well, plants grown on without disturbing the roots, will almost invariably run out until they become almost wholly green. A. Hemsley, in "American Florist," September 12, 1896.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. White, Burford, Dorking.

Shading, &c .- Dendrobiums, Cattleyas, Epidendrums, Cyrtopodiums, Catasetums, Schomburgkias, the deciduous Calanthes, and all terete-leaved Orchids should be exposed to the sun's rays as much as is possible. The whole collection of pseudo-bulbons kinds will be benefited if plenty of light be admitted There is no other period when the to the plants. plants appreciate direct sunshine as now. growth made early in the season by Acrides, Sacco-Libiums, Vandas, Renantheras, and Angræcums also requires exposure to the sun for several hours each morning, and all shading may shortly be dispensed with. The sun may still, however, be too strong for Phaltenopsis, Bolleas, Pescatoreas, Cypripediums generally, Phaius, Angraecum Ellisii, A. citratum, A. Sanderianum, A. pellucidum, Anectochilus, Codo-gyne Cumingii, C. asperata Lowii, and C. Veitchii, and they should therefore be shaded independently of the other occupants of the house. Some of the Oncidiums, Odontoglossums, Masdevallias, and other cool-growing Orchids may be injured by exposure to extra sunlight.

Pests.—Thoroughly cleanse the houses of insect pests by funigating them on two successive evenings with the XL All vaporiser. Look carefully over the newly-potted plants in the cool hones each evening in order to entrap any slugs that may have been brought in with the sphagnam moss used in the potting compost. To the same end use as traps some young Lettuce-leaves, pieces of l'otate, bran, &c.

Miscellaneous Plants.—The dwarf-growing Ladia pumila and its varieties now throwing up their flower-spikes should be removed from the cool-house to a light position in the intermediate-house, and liberal supplies of water at the root will be necessary until growth is completed, when the plants may be repotted if this be necessary. Small shallow pans are more suitable than pots or baskets, and only a small quantity of peat and moss is requisite for the plants to root in. Plants of Miltonia vexillaria that have been in the cool-house during the summer should be placed in the Cattleya or intermediatehouse, but they will require an abundance of fresh air. The following Orchids should also be removed to an intermediate temperature as the nights become eolder: Miltonia Phalænopsis, Masdevallia tovarensis, M. Wendlandiana, M. ionocharis, and all Masdevallias of the Chimæra section, also Odontoglossum Krameri, O. cirrhosum, and O. Harryanum. In the cool house, plants of Oneidium varicosum are sending up strong many-branched flower-spikes, and it should be remembered that these plants quickly exhaust themselves if allowed to retain their flower-spikes too long. It is advisable to cut the spikes immediately the flowers are fully expanded, and if they be placed in water will remain fresh for a considerable period. Oncidium concolor will not require quite so much water as when in full growth; and the compost should be kept just merely moist until the flower-spikes appear. Oncidium Krameri and O. papilio preter a light position in the East-Indian house; they may be grown in baskets or pans with a very small quantity of material to root in, and they should be suspended near the roof-glass. It is advisable to remove the flower spikes from these plants as soon as they have produced three or four flowers,

THE KITCHEN GARDEN.

By CHARLES HERRIN, Gardener, Dropmore, Maidenhead.

Cauliflowers — Plants from August sown seeds may now be pricked-out into suitable quarters, Where hand-lights are provided for wintering them out-of-doors, the plants may be placed in these. such case the land should first be well prepared by deeply working it, as this position will be a permanent one for the majority of the plants. A moderate dressing of half-rotted dang may be dug into the top spit also. Make the ground firm by treading when dry enough, and place the handlights in lines, leaving about 13 foot between them. If these be about 18 inches square, six plants may be wintered in each; one at each corner, and two central ones, the latter being eventually transplanted. After planting, a little lime or soot should be scattered among the plants. If I and lights are not to land, a supply of plants may be kept through the winter in cold frames. Spread on a hard bottom about 4 inches of moderately-stiff soil containing some old Mushroom-bed manure. Level and make it mo legately firm, then prick-out the plants at 5 to 6 inches apart. A number of plants may be potted-up in 3-inch pots, and wintered in similar frames. Keep the lights partially closed until the plants are partly established, but expose the plants afterwards at all times when frost is not present. If the spare plants be planted in sheltered corners, they may stand the winter if it be not very severe. Cauliflowers of the Autumn Giant type now heading-in should be protected from slight frosts by having the outer leaves twisted over the heads; growth has been very rapid during the past month, and will be very susceptible to injury from frost should this set in

Cardons.— For blanching these, some sweet hay-bands are very suitable, and they should be bound carefully, and not too tightly around the stems. Blanching may also be done with brown paper bands, afterwards earthing-up the stems with soil.

Mushrooms.—Beds should now be prepared in the Mushroom-house, the manure for which should have been thoroughly prepared by frequently turning it over and be in a state of dryness. If the manure becardly, take it into the house, make the beds, which should be thoroughly well beaten, and insert the spawn. The spawn used should be fresh and of the best quality obtainable. A good brick is thoroughly permeated with white cotton-like threads, and all dark looking ones should be rejected. Break up an ordinary-sized brick into about eight pieces, and meen the pieces flat-wise 6 inches apart just below the level of the surface of the manure, beating them in firmly with the hands. Should there be any doubts as to the heat remaining moderate, the beds may be

left for a few days before soiling over. Insert a stick, and after twenty-four hours if this feels but comfortably warm to the hand, the bed may be cased over to the depth of half-an-inch with loamy soil that has been passed through a half-inch sieve, and afterwards well beaten down with a spade.

General Work. — Advantage should be taken of dry days to continue the earthing-up of Celery. Where the tops are tall and likely to break down, tie up the leaves of each heal with a piece of matting. Walks should be cleaned, and Box-edging may be relaid if necessary. Clear away old Pea and Bean haulm, and any weeds and rubbish that exist, and burn them in an out-of-the-way place. The sticks should be bundled up and taken to the wood-yard. Should frost appear probable, gather all Runner Beans which are ready for use; they will remain fresh and good for ten days, if laid out thinly in a cool shed.

THE FLOWER GARDEN.

By Hebery Warken, Gardener, Aston Clinton, Tring.

Decidnous Trees and Shrubs—Planting-time having arrived, any operations required in planting, lifting, and replanting should be pushed forward with despatch. If shrubs are purchased from a nursery, it is prudent to select those of moderate size of their kind, as these are removable with more safety than larger ones, and much is saved in railway charges and cartage. In digging out deciduous trees on the place, much of the soil about the roots should be retained, and although this is contrary to what is unually done, the good effects are apparent the first season in the strength with which the buds open. When trees are removed from a distance, not much soil can be kept about the roots, but care should be taken, however, to enwrap the roots in damp straw or mats.

Late-blooming Roses.—Although Roses were injured by drought, many Teas and H.-P.'s are giving good flowers, and in some instances these are finer than the first ones. Some varieties appear to be less affected by drought than others, viz., the H.-P.'s: Captain Christy, Duchess of Bedford, Duke of Teck, John Hopper, Mrs. John Laing, La France, Ulrich Brunner, Alfred Colomb, and François Michelon. Teas: Madame Bravy, Jules Finger, Edith Gifford, Rubens, Madame Hoste, Madame Caroline Kuster, Madame Lambard, Marie Van Houtte, Souvenir de S. A. Prince, Anna Olivier (very good), The Bride, Catherine Mermet, and Bouquet d'Or. Although many others are flowering, the above-named varieties afford the best display of bloom.

General Work.-The recent gales have done much damage, as well as littered the garden with leaves, &c., and the amount of sweeping and clearing up entailed will in most places be very considerable. Dahlias and other tall plants have suffered greatly, and the quantity of bloom on the plants will be much curtailed. It will be necessary to make safe by broad strands of matting all shoots of the Dahlias not actually detached from the plants, making them as presentable as circumstances will allow. The mixed flower borders, now past their best, should be afforded a general tidying, and be planted or partly re furnished with Wallflowers in variety, Canterbury Bells, both single and double-flowered; Allysum, Sweet Williams, biennial Stocks, and other hardy plants for flowering in the spring and early summer. Besides the above, small patches, &c., of early and late-flowering bulbs may be planted. The lawns, if in good condition, should still be kept somewhat closely cut, thereby saving much trouble and time in sweeping up the tree-leaves. Gravel walks that may have been heed and left in a rough condition for a few days may now be raked level and rolled. Even if no fresh gravel be added, the walks after such a loosening up and rolling will be greatly improved in appearance. Preparations should soon be made for refilling tho flower-bods with bulbs and spring-flowering plants. Where the beauty of the plants has departed in a hed or beds, the operation of digging, manuring if necessary, and planting with the above, should be undertaken without delay. Seeds of hardy annuals may be sown, and as many of the plants pass through an ordinary winter unburt, it is an advantage to have flowers earlier and larger than spring-sown ones.

FRUITS UNDER GLASS.

By W. Port, Gardener, Highelere Catle, Newbury

Mut-season tirape-vines. - In Vineries from which truit has been cleared, the Vines will be the better for a little attention being paid them at the present time, sub-laterals being renewed, and the main

laterals shortened somewhat, but not so much so as to remove the principal leaves, as on their preservation the complete development of the buds for next year depends. A free circulation of air is necessary in such vineries, and if there is doubt about the wood being thoroughly matured in time, a small quantity of artificial heat should be afforded for several weeks. The spent mulching on the borders should be cleared off them, and as much of the surface-soil taken away as possible without disturbance of the roots, and a top dressing of freshly-cut loamy turf, with a small quantity of Thomson's or Bentley's Vine-manure and some charcoal applied. If the loam is close and heavy, it should be mixed and used when in a fairly dry condition, and only a moderate quantity of water afforded to those Vine-borders which are in the vinery, the outside ones needing no water. If the vineries are used for soring plants during the autumn, a wooden trellis should be placed on the surface, and the plants placed on it.

Later-keeping tirapes.— These being now quite ripe, a dry moving air should be maintained as a means of preventing the decay of the fruit, which surely takes place in a stagnant state of the air. The warm are also brings out the sugary constituents of the fruit, an essential point in trick-skinned late-keeping varieties. Artificial heat should be afforded during dull weather, and also at night, with a slight amount of air admitted constantly by the upper ventilators. A temperature of 50° to 55° at night should be allowed, with a rise of 5 to 10° in the daytime. The inside borders should not be allowed to get very dry. When affording water, the mulching should be drawn aside, and returned over the soil when the job is finished. Choose a fine, bright day for affording water. Young Vines planted in the spring should now have the laterals removed, taking care, however, in doing so, to preserve the principal leaves intact; and to let the Vines be exposed to light and air, so as to ripen the wood.

Pines.—The plants of Cayenne and Black Jamaica now swelling their fruits should be supplied when dry with weak guano-water; and a moist, genial state of the atmosphere maintained. Where the soil has sunk much in a pot, a top-dressing of turfy loam and horse droppings in equal proportions may be put on the top, pressing it well round the stem of the plant. Sprinkle the foliage and the surface of the plunging material occasionally on fine days, when the house is closed, which may be sufficiently early to allow the interior warmth to rise to 85° or 90° for a time. If the accently-potted suckers have started to make roots, they must be placed in pots of 8 inches in diameter without delay, and in these the plants will remain till the spring. A bottom-heat of 90 to 95° should be maintained for rooted suckers till the roots have permented the soil. A sturdy condition of the plants may be ensured by ventilating the pit freely whenever the weather is favourable for the purpose, a bottom-heat of 80° being steadily maintained, and water and weak liquid-manure afforded when required. The plants should be examined twice a week, to ascertain their condition as regards root-moisture. Be sparing in the use of the syringe.

PLANTS UNDER GLASS.

By JNO. McINTURE, Gurdener, Woodside, Darlington. Hard-wooded Plants that are still out-of-doors should be housel, without delay, presuming that previous directions for cleansing them have been carried out. The best structure for a collection of hard-wooded flowering plants is a dry airy house, in which there is sufficient heating apparatus to prevent first entering. Avoid, as far as possible, mixing them with softwooded plants, except when the plants are in flower.

Winter and Spring flowering Bulbs.—Continue to pot-up batches of Hyacinths, Tulips, Narcissus, and other Dutch bulbs, or the entire stock may be potted at once and plunged in ashes. By growing them afterwards in different temperatures a succession of bloom may easily be obtained. Plunge them in ashes or other fin ly-sifted material, and cover the crown of bulb with river sand, to prevent the growth from rust at the stage when it first appears from the bulb. The bulbs will be ready for removal from the ashes when they have made I inch of growth, and it is essential that they be not suffered to remain longer, in which case the growth becomes weakly. When they are taken from the plunging material, place them in cold frames where they may be protected in severe weather, and remove batches of them into heat as required. The earliest plants of Roman Hyacinths may be put into heat at once for furnish-

ing flowers in November. The old double yellow Nareissns Telamonious plenus is a most useful bulb for growing in pots to use as decorative plants. Well-ripened bulbs may be easily forced to produce flowers at Christmas, and they are very free-flowering. Potup at once as many bulbs as will be required, and plunge similarly to the others. It is well to use both 5-inch and 6-inch pots, putting eight or ten bulbs in each, filling in with any ordinary rich compost. About six weeks is necessary to bring them into flower. Lilium Harrisii should be treated much the stender than most bulbs, and should not be allowed to become frozen.

tinerarias.—Do not permit the plants to become pot bound, but shift them into larger pots as soon as this is needful. The compost should consist of loam, leaf-soil, and dried cow-manure, adding about one-fourth part of sharp river-sund. Pass the cow-manure through a ½-inch sieve. For the present, keep the plants in cool, airy frames, but remove them to a house when mats do not form sufficient protection against frost. Some of the plants should be ready for their final shift into 5-inch pots, in which size they flower much earlier than others with more root--piec. When the plants are approaching the flowering stage, they may be fed with a weak solution of sheeps dropping.

Pelargoniums. — In order to obtain very early plants, a few of these may now be cut hard back, and when they have commenced to break afresh shake them out of their pots, and re-pot them into a size smaller, using a compost of good rich loam two parts, leaf-soil and river-sand one part each. Pot them firmly, and spray them over with the syringe until roots have formed. A low spanroofed house or warm pit is well adapted for their culture.

Herbaccous Calecolarias should now be moved from 3-inch pots into larger ones. A compost of rich fibrons loam, and a sprinkling of sharp sand, is the best for them. Keep them as cool as possible, in frames containing ashes, taking care to elevate the plants near to the roof-glass. One of the commonest reasons of failure in the culture of Calecolarias is due to the plants becoming attacked by aphis; on the first appearance of this pest, they should be fumigated gently on two or three successive nights. If funigated strongly the plants are higher to injury, and care should be taken that all the foliage is thoroughly dry before communicing this operation.

THE HARDY FRUIT GARDEN. By G. Woote Avig, Gardener, Rolleston Hall, Burton-on-Trent.

Walants should be left upon the trees until the nuts leave the husks naturally; they will then be freer from stain. When the nuts appear to be ripening, give the trees a good shake occasionally until the whole of them are secured, and the nuts will be uniformly matured. Have them thoroughly well dried, and afterwards pack them into tubs or large jars, and cover each layer of nuts with a layer of silversand and a sprinkling of salt. They may then be stored in a dry and cool place.

Raspberries. - If any new plantations be necessary, the ground should be well trenched; at the same time work into it a heavy dressing of manure. In soils of a light nature, plenty of well-rotted manner will be required, but heavier and retentive soils should be afforded mannre which is only partially decomposed, and at the same time add planty of mortar-rubble. The site chosen should be one that is perfectly free from Couch-grass and Corn-bine (or as the latter is often called Lap-love and Bindweed), the roots of which are very difficult to eradicate from the fibrous roots of Raspberries. Of voicties, one of the best is Superlative. It is hardy in constitution, a heavy cropper, and in ordinary seasons it produces good fruits until the middle of September. Carter's Prolific, and Northumberland Fillbasket, may also be recommended. Of the yellow fruiting kinds, Magnum Bonum, White and Yellow Antwerp are the bost. Autumn fruiting varieties include Octob. r Red, and October Yellow. Ruspberries may be trained in various ways, but, for general purposes, the espalier treatment is the most convenient. For this mode of training, the rows should be not less than 4 feet apart from each other, and they should run north and south, the plants being 2 feet distant from each other in the rows. Light iron hurdles, having two horizontal bars, are capital supports for training the canes to, and if given an occasional coat of paint or black varnish, they will last for a number of years, and present at all times a tidy appearance.

Fruit Gathering. — This will still require close attention in order to harvest the fruits when in a dry condition. Any Morello Cherries, or red and white Currants that still hang upon the trees should be frequently examined, as they are apt to decay during wet weather.

THE APIARY.

By EXPERT.

Feeding the Bers.—The showery weather last month is causing bee-keepers much trouble and expense, it having been impossible for the bees to gather nectar, consequently the stores have diminished very much, and many hives which would have withstood the winter without artificial aid, will now require a few pints of syrup to enable the immates to make up for the loss of honey. The feeding should be done as quickly as possible, to allow them to seal over the combs before cold weather sets in; unscaled combs fermenting, and causing dysentery. In feeding, keep the bees well supplied with syrup till they have sufficient to winter upon.

have sufficient to winter upon.

A good many hives of driven bees will be found (even after being well fed) to be in a weak state, owing to the bad season, in which case it is advisable to join them to another lot that may require strengthening, after taking away the queen from the weaker lot, as it pays much better to keep one strong hive through the winter than two weak ones, if you even manage to get the latter through the cold weather. uniting bees, be as expeditious as possible, as at this time of year the brood, if exposed, will get chilled before uniting; and do not om t to dust both lots of bees with flour, otherwise they will fight, and many will be killed. When feeding, place plenty of quilts over the feeder, to afford warmth, and encourage the bees to take the food down, or they may be inclined to cluster in the centre of the frames instead of taking down the syrup; if this is carefully seen to, many hundreds of bees may still be hatched out, which will be found a great advantage in the spring.

Candy. -A cake of candy placed in each hive over the broodnest, on the top of the frames, whether they are a strong colony or not, is a sure preventive of starvation in the winter, when there is no chanco to examine the hives. I find the following receipt ('owan's) is the best for making candy, viz.,—Put about three quarters of a pint of water into a tin succepan or fish-kettle; let this boil, then add 6 lb. of the best white sugar; keep boiling, and stirring the contents to prevent burning. To ascertain if it be sufficiently cooked, dip a finger into cold water, and then into the boiling sy up, and back into the waterif done it will be found crisp and brittle; and having placed a piece of paper in some sau ers or soup-plate: pour the eurdy into these, place on the frames with the paper a thering; this will prevent the quilt getting Be sure the sugar does not burn in the boiling, as this will be very injurious to the bees, and no amount of boiling will make it set hard. For stunglating food, stir into the syrup when boiling I lb. of Pea flour.

Quilts.—These should always be cut of the exact size to cover the frames without turning them up at the sides; cheap stair curpet, about 1d. per yard, or felt, make good coverings; and some bee-keepers recommend American cloth for the first quilt, and then wrap up with three or four extra blankets or carpets, chaff, &c. A cheap and good plan is to purchase a few old Government blankets; cut these to the proper size, and sew three together, with glazed naphthiline sprinkled between each piece; this will keep them warm, and the naphthaline will keep the wax moth away, and also help to prevent any disease appearing amongst the bees. In cases where straw skeps are used, see that they are well protected with wire netting or other means from the ravages of mice and rats, which are great chemies to bees in the winter.

A NEW VIBURNUM.—In the Botonical (ia:ette, U.S.A., W. DEAN and B. L. ROBINSON describe and figure a new species of Viburnum, apparently closely related, on the one hand, to V. dentatum, L.; and on the other to V. pubescens, Pursh. The plant was discovered by Mr. Demerrio, near Cole Camp. Benton County, Missouri, in July, 1894. It is distinguished from V. dentatum (which it most resembles in foliage) and V. Molle by its longer and much more compressed fruit and seed. It differs from V. pubescens very decidedly in foliage, having much more orbicular, deeply cordate, and much longer petioled leaves, which are also of a larger size than any of the related species. It has been named V. Demetrionis.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to being under the notice of hortculturists.

Newspapers.—Correspondents sending messpapers should be careful to mark the paragraphs they wish the Editor to see.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—53°.

THE third annual exhibition of The Fruit Show. British-grown fruits, under the auspices of the Royal Horticultural Society, may be described, equally with its predecessors, as a satisfactory one. We say this without implying that the exhibition that has been opened but a few hours since is equal in extent to the one held last autumn. That exhibition and this one have been held under very opposite circumstances indeed. Rarely is it our privilege to experience such a wonderfully good fruit season as that of 1895, nor must we expect the average exhibition to be equal in quality to the one then held. As we have said, the circumstances this season have been unfavourable, to the production of hardy fruits, and to substantiate this, we may refer our readers to the icmarks upon the crops with which we were favoured by our correspondents, and which were published a few weeks ago, But it is the autumn especially that has been adverse to the exhibition of fruits grown in the open, for the winds and storms that have prevailed during September have been, in a measure, phenomenal.

It is due in a large measure to the conditions of September weather that there are fewer collections of fruit staged on this occasion. and this is the weak point in the display. Competition is less keen and numerous. As to the quality of the fruit upon the tables, generally, there was little to which exception could be taken. Apples are not quite such splendid fruits as those of '95, but in many instances, this season, they have assumed a capital colour. Pears are better represented than Apples, and in the classes the competition is better, but we believe there is not a single dish of Williams' Bon Chrétien in the show, a circumstance due to the early character of the season. Grapes are of average quality; some of the bunches are such as give a fruitgrower considerable pleasure to view, and among these the unequalled variety Muscat of Alexandria is well shown.

There are considerable exhibits from the trade of an honorary character, but there appears to be a growing indisposition to enter the competitive classes on the part of many nurserymen, which may involve at a future time the making of arrangements that will offer to the trade a greater measure of recompense than they may at present expect.

In the compilation of the schedule, we regret that the classes which last year were framed with the object of attracting exhibits of dried and bottled fruits, have been wholly omitted. Sir T. LAWRENCE, in a speech he made at the Crystal Palace last year, drew attention to the importance of the question of preserving, by means of diving, that portion of a year's fruit crop that may be in excess of the immediate demand. We are convinced that Sir T. LAWRENCE was right in taking such a view of the matter, and at all times and seasons this question should be pressed upon the attention of horticulturists in this country. Of course, we

are aware that there has been little response on former occasions to the invitation for dried fruits; but, perhaps, that is the more reason why the efforts should be continued.

There is one detail in the management of the exhibition that calls for approval. On the exhibitor's card, in each instance, there appeared, in addition to the number of the class, a cutting from the schedule, which in print clearly set forth the conditions and requirements of the class.

This afternoon the lecture was upon "the importance of British fruit-growing from a Food point of view," and on Friday and Saturday there will be lectures and discussion upon "The Cider and Perry Industry," and "Gathering, Storing, and Profitable Utilization of Apples and Pears."

Before we conclude, we desire to express the regret that most of our readers feel that Mr. Head, who is usually so active at horticultural displays at the Palace, is lying seriously ill at his residence. Mr. Head, who has recently sustained a most serious operation, has the sympathy of all horticulturists who know him.

A GREAT deal has been done of street Pluring. late years towards the embellishment and samitation of our towns by the planting of trees in the streets, and by the conversion of town squares into gardens. Of the great benefit that has accrued, of the immensely improved aspect of our towns, there cannot be the slightest doubt. It is even questionable whether the merely decorative part of the business is not in some cases overdone, and whether, when the space has been properly laid out and planted, the cost of decoration as apart from maintenance) might not fairly be left to private munificence; and the pockets of the ratepayers, to this extent, 1elieved of the demands made upon them. There is another question which requires consideration -How tar, or for how long a time, is this treeplanting likely to be successful in the future?

Some of the trees planted in our streets, when properly looked after, look well enough now. But how long will they continue to do so, or to improve? The answer to this question must necessarily be vague and indeterminate, but, at the same time, there can be no question that the decay and ultimate death of most of these trees must occur at a period long anterior to the average age of the particular kind of tree. This premature failure is due, we believe, not so much to unfavourable conditions of the atmosphere, except, of course, in the vicinity of chemical works, as to faulty methods of planting. Take, for instance, the trees on the Thames Embankment. They were originally planted too closely, and no thinning has ever been carried out. Planes come under the category of forest trees in the sense that they are trees of the largest size, and, therefore, they are not suitable for narrow streets or for confined spaces, where they must naturally encroach too closely on the houses, and deprive the inmates of light and a free circulation of air. But on the Embankment there are no houses, and the trees have by annual curtailment been so far kept within bounds, and their shape, as far as clipped trees go, is not unpleasing. But the endurance of these trees, great as it is, will come to an end some day from starvation and root-suffocation. A space covered by a grating is, it is true, placed round the base of each tree, and through that space water and air (meaning oxygen) are supposed to find their way to the roots; but as every

physiologist knows, the minute root-fibrils and root-hairs which take up the water and the matters required for the nutrition of the plant are not placed near the base of the trunk, but some distance off, where they can avail themselves of the drip from the leaves. The most active and the most important parts of the roots, from this point of view, are sealed up beneath flagstones, hard Maradam, or impermeable asphalte. True, the roots will, as we all know, travel in search of moisture and make the best of circumstances, but in our streets where are they to go? Where will they find the requisite moisture?

Diffusion and capillary action, no doubt, reuder all important service in these cases, but there must come a time when these agencies will fail, when the soil will become "sour," destitute of life-giving oxygen, and exhausted of its nutritive properties. A tree manages by leafagency to manufacture and to store in the bark so much nutritive matter, that it will for a time and to a certain limited extent, be comparatively independent of its roots. This is probably one reason why we occasionally meet with trees which manage to exist for years under the most unfavourable conditions. We remember two cases which we have known for a half of a century, the one is a Maple, originally an iumate of some garden, but now so placed that the pavement comes close up to the trunk without any interval, whilst the finer roots are under the hard roadway, where water and air can with difficulty penetrate, but where gas from leaky pipes finds a passage, as is evidenced from the blackness of the soil when disturbed. This particular tree has not much increased in size for years past, but it manages to live on, and is in a healthy condition. The other case is a Laburnum, of some fifty or sixty years of age. Its trunk is completely buried up to the level of its lowest branches by L5 feet of soil, stones, and rubbish -and yet the tree is quite healthy. In this ease the feeding-roots are doubtless several feet or yards it may be away under a lawn. These two instances, and especially the first one, seem to conflict with our previous vaticination. Nevertheless, it seems clear that it can only be a question of time, and that the life of the tree will be materially shortened. In any case no planter will question the propriety of affording to the roots an adequate supply of water and air, with ample drainage, so that no stagnation and consequent gradual suffocation of the r ots may occur.

The Parisians had the start of us in embellishing their streets, and they carry it out even now on a scale beyond anything we attempt. They have accumulated experience as to what trees to plant in particular localities, how to plant them, in fact, how best to put the trees into such a position as best to adapt themselves to the "environment" surrounding them.

In former years we have had occasion to note the splendid publications on the plantations in Paris by Alphand, Bariller des Champs, Andri, and others, but a smaller and more handy volume was needed, and this has now been supplied us by Mr. Chargueraud.*

The work has been published under the anspices of the Prefect of the Seine, and our County Council would do a useful service by causing the book to be translated. It deals with avenue or street-planting, giving ample details of the method of planting, the species of trees to

^{*} Traité des Plantations d'Alignement et d'Origement dans les Valles et sur les routes Departementales. Par A. Chamguerrat d. Ouvrage orné de 1830 gravures. (Paris : Rothschold, 1896.)

be selected, their management, the diseases and njuries to which they are subjected. Under this latter heading we fail to find mention of the injury from heavy steam-rollers, such as we saw some years ago in a street in the west of London. The number of street trees in Paris is given at 122,877, of which 26,000, in round numbers, are Planes, 17,000 Horse-Chestnuts, 15,000 Elms, 9000 Ailanthus, 6000 Sycamores, 4000 Maples, 4000 Robinias, 2000 Limes, 1000 Paulownias. The other species used are numerous in kind, but the numbers of individuals are small; thus we are astonished to find only 12 Poplars mentioned (p. 249), 4 Ashes, 1 Catalpa, 1 Oak, 1 Mulberry, 1 Sophora. Tho figures apply to street trees (arbres d'alignement) only; but even allowing for this circumstance, we suspect some error in the enumeration, if not, our neighbours do not avail themselves of their resources.

The second part of M. Chargueraun's volume is devoted to planting along the roads in country districts, and deals not only with trees for shelter and firewood, but also with fruit-trees. We have heard enough of the objections on the score of marauding boys. With a proper selection, sufficient might be grown to satisfy the stomachs of the thieves, and yet leave a large margin over for culinary or manufacturing purposes, for, of course, no one would plant under such circumstances the choicest varieties.

We need not discuss this matter further, but in conclusion strongly commend M. CHARGUE-RAUD'S volume to the notice of our readers.

THE NATIONAL CHRYSANTHEMUM SOCIETY .-A largely-attended meeting of the General Committee took place at Anderton's Hotel, on Monday evening last, Mr. B. WYNNE in the chair. After the transaction of preliminary business, the following resolution was carried by acclamation: "That the President. Sir Edwin Saunders, be requested to convey to Her Most Gracions Majesty, the QUEEN, the heartfelt congratulations of the National Chrysanthemum Society upon Her Majesty's long and prosperous reign, which has now exceeded in duration that of any previous monarch of this country. The Society also desires to assure Her Majesty of the loyalty and devotion of the numerons members, not only in this country, but in all parts of the world." The Secretary laid upon the table the index of a new Register of Members which had been prepared, and which contained the names and addresses of 834 members; and further stated that there were 134 societies in affiliation. He also announced that he had just completed the third Minute-book, and they had now in their possession the continuous records of the Society for the past thirty-five years; the carlier records of the society have been unfortunately destroyed by fire. Those in their possession dated from the annual general meeting of members held on December 12. 1861. The financial statement made by the secretary showed that the sum of £371 19s. 6d. hal been received during the first half of the present financial year, and the Special Jubilee Fund amounted to £282 17s., in addition to £201 given as special prizes. The chairman said that a further sum of £100 was required to ensure a financial success to the Jubilee celebration, and exhorted the members to use their best endeavours to obtain that sum. It was resolved that the annual dioner take place at Anderton's Hotel on Thursday, November 26, and that on this occasion the representatives of the gardening press should be invited. Forty seven new members were elected, including three Fellows, the secretary announcing that since February 1, nine Fellows and 129 ordinary members had been elected. Among the members elected on this occasion were Signor A. SCALARNDIS of the Royal Gardens, Mouzi, Italy; and M. COULLAID, Registrar of the French National Chrysanthemun Society. Four societies were admitted to

affiliation, including the French National Chrysanthemum Society, the secretary announcing that it was the twenty-sixth society affiliated since February 1.

EALING GARDENERS' ASSOCIATION.—The eighth annual meeting of this body was held on the evening of Tuesday, September 29. From the yearly report then submitted to the members, it appears that the Association is in a flourishing condition. There has been a satisfactory increase both amongst the honorary and ordinary members. The meetings (come twentyfive in all) held in the Session 1895-96, were well attended, the papers and the useful discussions resulting therefrom were of a high order of merit, and the prizes offered at stated periods by gentlemen resident in Ealing and the neighbourhood (added to those offered by the Association), for table plants and flowering plants, brought out keen contests, thus adding con-iderably to the attractiveness of such meetings. A very laudable practice, favourably referred to in the report, is in vogue here, the setting apart of certain evenings during the Session for the discussion and answering of questions collected at previous meetings on various matters appertaining to gardening, the difficulties encountered, &c., on which information is desired. By this method of procedure, much useful knowledge resulting from varied experiences, is obtained; indeed, a night's questions may be described as a series of short, concise, pithy papers, and put into practical form, as the experience gained in every-day practical work connected with the garden and its varied surroundings. Question-night is an institution that deserves imitation by kindred societies Regret was very properly expressed that the prizes for essays on gardening subjects had had but a poor response, and the younger members especially were earne-tly urged to enter such competitive lists more keenly in the future (when prizes will be again offered), as a means of carrying out one of the chief aims of the association, viz., the encouragement of mutual improvement. The association also remembers the claims of the Royal Gardeners' Orphan Fund; for on Sept. 24 the Secretary, Mr. WALTER ROBERTS, paid into the Fund of that worthy charity the sum of £15, the result of a collection at a smoking concert; and when matters are finally adjusted, it is anticipated that there will be a bilance of a few more pounds to hand over to the Fund. The receipts during the session, 1895-96 amounted to £67 9s.; expenditure, £60 13s. 6d.; leaving a balance of £6 15s. 6d. in hand. A good list of papers has been secured for the forthcoming session, 1896-97; and thanks were accorded to this journal at the meeting under notice for its references to the work of the Association during the preceding session; and also to the chairman, S. A. SEWELL, Esq.

LIME IN PLANT CHEMISTRY. - In a recent issue of the Annals of Botany (Vol. X., No. 37) P. Groom gives an account of some experiments on the function of calcium in plant chemistry. It is well known that plants will not thrive unless supplied with a small amount of calcium in their food; one of the symptoms of mal-nutrition when this element is absent being the accumulation of starch in the tissues. More than twenty years ago BOEHM came to the conclusion that one of the functions of calcium was to assist the earrying of earbo hydrates. Working subsequently on the same subject, A. F. W. SCHIMPER showed that, in plants which normally contain crystils of calcie oxalate, oxalic acid is a bye-product in the building up of proteids, and that, in the absence of calcium, acid potassic oxalate accumulates in the leaves and buds and acts as a poison. He concluded that the calcium served to neutralise this salt, but played no fundamental part in the conduction of carbohydrates, since these were proved to travel without a corresponding movement of calcium. Groom suggests that the choking of the tissues with sturch may be due to the fact that potessic oxalate acrests the change of starch into sugar, and shows by experiment that the diastatic action of extract of malt upon arrowroot-sturch is hindered by even very dilute solutions of the acid salt; also that the same substance

retards the process of the change of starch into sugar in the living leaf of the Canadian water-weed (Elodea canadensis); and further, as the soluble oxalate accumulates, that the munufacture of starch is retarded, and, finally, the protoplasm is killed. The possibility of the diastatic action in plants, which, like Oxalis, normally contain a considerable amount of acid potassic oxalate in solution in their leaves, is explained by the fact already elucidated by GIESSLER, that the salt is stored in the epidermis, not in the assimilating tissue. GIESSLER suggested that the object was protection from snails and the like, but GROOM thinks, from his own experiments, that the protective significance is at most secondary, and that the primary reason of the superficial storage of the oxalate is because its presence in the underlying tissues would derange the metabolic processes. Natural Science.

VARIETIES OF CEDAR. - It is not generally known that the term Cedar in commerce is not a generic one. The pencil Cedar is, strictly speaking, Juniperus virginiana, but J. bermudiana is also used for the same purpose, the wood of the two trees being practically indistinguishable. The Cedar of Lebanon, Cedrus Libani (Barrel), and its two varieties, the African Cedar, C. atlantica (Manetti), an I the Indian Cedar, C. Deo lara (London), do not appear to be distilled for oil. Other trees known as Cedars are the West Indian White Cedar, Tecoma leucoxylon (Mark), the American Red Cedar, Thuja occidentalis (Lum.), the Californian White Cedar, Libocedrus decurrens (Torr.), the New Zealand Cedar, Libocedrns Bidwilli (Hook.), the Australian Red Cedar, Cedrela toona (Roxb.), and the West Indian Cedar, Cedrela odorata. The last is of interest, as being the wood of which eigar-hoxes are made. It is also largely used for cabinets, wardrobes, &c., in the West Indies, since insects have a strong dislike both to the olonr and the taste of the wood. It would seem, therefore, that the volatile oil, of which Messrs. Schimmel obtained 3 per cent., would be more valuable than that of Juniperus virginiana as an insectifuge. The waste wood from the manufacture of eigar-boxes could easily be utilised for this purpose. The oil has a specific gravity of 0.915, and boils between 265° and 270°, and has an optical rotation of 5° 053 in 100 mm, tube, Mr. Hart, in "Bulletia Botanical Gardens, Trinidad.

AGARICUS CAMPESTRIS.—If we may judge from the numerous communications received from residents in the country, the weather is extremely favourable to the growth of the common edible Mushroom, and doubtless of many other fungus of which, of course, the laity take no cognizance. It would seem that great heat, followed by abundant raius, are the necessary conditions of an abundant year.

ORCHIDS UNTRUE TO NAME .- It may be of interest to Orchid dealers and fanciers to allude to a case which was noted in the Orchid Review for the present month. A case came before his Honour, Commissioner KERR, at the City of London Court on Tnesday, August 4, the plaintiff being Mr. D. B. RAPPART, Promenade, Liscard, Cheshire, and the defendants, the executors of the estate of the late Mr. G. D. Owen, Selwood, Rothesham. The former gentleman purchased at the auction sale of this wellknown collection, several choice and valuable species and varieties, part of which, upon flowering, proved untrue to name, and of little value; and not feeling disposed to stand by such a bargain, he made an application for the high prices paid to be refunded. This request being met by refusal, the plaintiff decided to bring an action to recover his rights. For the plaintiff, there appeared two well-known experts, who testified to seeing the plants in flower, and that they were not true. A third expert also appeared, who could testify that no variety of Orchid would alter its character by changing into another variety. Verdict for the plaintiff with costs. Generally speaking, mistakes of this kind are acknowledged by the seller, and compensation in some form or another given, and had the defendants been well advised, the case should not have been allowed to come into court.

LIFTING THE ROOTS OF STREET TREES .-Garden and Forest for August 26 gives the following on this subject, which may afford a hint to town surveyors and others. Sometimes when the grade of streets or grounds is to be raised, it is desirable to elevate the trees at the same time. Near Philadelphia, according to Mechans' Monthly, trees 50 feet high, and with trunks 18 inches in diameter, are lifted with very little cheek to their growth in the following way. A trench is dug around a tree so as to leave a ball of earth, and when it is dug to the proper depth, the earth is spaded from under the ball on one side, and a block set under the roots as a fulerum. Two guy ropes are then attached to the tree, one on the side where the block is set, and the other opposite it. When the rope toward the block is drawn, the tree is tilted, and the mass of roots is lifted up on the opposite side. Earth is then packed under the elevated roots, and then the rope on that side is drawn. This lifts the roots on the block side, and more earth is placed there. In this way the tree by being swayed backward and forward, having earth thrust under it at each tilt, is soon elevated as many feet as is needed, and stands on the summit of a firm mound of earth.

THE NEW CEMETERY AT DOUGLAS, ISLE OF MAN.—We learn that the 1st prize offered by the Town Council of Douglas, Isle of Man, for a plan for laying out the new borough cemetery has been awarded to Messrs, W.M. Fell & Co., nurserymen, of Hexham. The grounds consist of about 12 acres, and fine views of Douglas Bay are obtained from them.

SMITHSONIAN INSTITUTE.—The death of Dr. Goode, and the absence of Professor Languer from the United States, prevented the fiftieth annual meeting of the trustees of the Smithsonian Institution (which was to have been held on September 7), from taking place. This was the first time in the existence of the institution that the annual meeting had failed to be held.

DR. TRIMEN.—We regret to learn from the Ceylon Observer that Dr. TRIMEN, the Director of the Ceylon Botanical Gardens, is somewhat seriously ill.

A NEW CHRYSANTHEMUM PUBLICATION. -Le Chrysanthème is the title of the first number of the quarterly report issued by the French National Chrysauthemum Society. From it we learn that the first Conference to be held under the auspices of the society will take place at Bourges on November 7. It is interesting to record that a special notice has been sent round to the various raisers reminding them that a registrar has been appointed, and asking them to submit the names of their new seedlings for approval so as to avoid the duplication of names. Le Chrysanthime contains a list of the officers and committees of the society, and a list of memoirs. The rules as passed at the general meeting in January are given, a translation of the Jubilee eircular of the National Chrysanthemum Society, and several other articles are also included.

ORNAMENTAL PLANTS OF NEW SOUTH WALES .- Mr. J. H. MAIDEN, the successor of Mr. Cu. Moore in the Directorship of the Sydney Botanie Garden, has done good service in drawing up a descriptive catalogue of "Some New South Wales Plants worth cultivating for Shade, Ornamental, and other Purposes." It was published in the Agricultural Gazette of New South Wales, and has also been issued separately. Primarily intended for the use of the citizens of New South Wales itself, it will be found useful in other parts of the world; and it is all the more valuable from being based on t'ie practical experience of the author, who has long been an experimental cultivator. A priced catalogue is given of seeds sold by a "Sydney firm," with size, e-lour of flowers, and native names. This is followed by a systematically-arranged, descriptive enumeration of a selection of native plants. The most vulnable part of this work consists of particulars The most of the soil and situation in which the plants grow naturally. Some of these particulars will doubtless come as a surprise, though none the less wel-

come, to gardeners who have unsuccessfully attempted the cultivation of some of the plants in question. Certain plants, we are informed, grow and thrive in fine sand, others in leys, others in swampy ground. Not less valuable are the selections of plants for various purposes, such for instance, as trees for street-planting, plants for the sea-side, sand-binding, and other purposes. We may add that this little publication is issued from the Government printing press at Sydney.

COLLECTIONS BY CHILDREN ON BEHALF OF THE GARDENERS' ROYAL BENEVOLENT INSTITU-TION.—In view of the recent correspondence in the Daily Telegraph as to the "good" and "bad" manners of children, it is a pleasing sign, as well as an encouraging feature, to find that some young people whose parents are connected with gardening, take a loving and active interest in the cause of charity. Here is a case in point, which we are glad to notice: Frances Parker, aged 9, the daughter of the well known gardener at Goodwood, has forwarded to the secretary of the Gardeners' Royal Benevolent Institution the sum of £1 5s., which she had collected in aid of the old people. We hope that little Frances Parker's worthy example will be followed by many other little folks, and with similar success. Our charities will never lack support so long as the rising generation are inculcated in the principles of henevolenea.

THE BRITISH ASSOCIATION.—The excursionists in the Isle of Man were on Monday, September 28, favoured with fine weather. The botanists drove to various places in search of specimens, including Snaefell Mountain and Bullamoar. At the latter place, which is low-lying, they inspected the fine collection of coniferous plants and other exotics. The archeologists visited the ancient forts at Ramsey, and the geologists drove to Pecl, and inspected the red sandstone rocks. At night the excursionists dined at Douglas, when the Lieutenant - Governor (Lord HENNIKER) was their guest.

THE WEATHER.—It is to be feared that much damage has been done in parks and gardens by the destructive gale, accompanied by rain, which visited the southern and western parts of the United Kingdom in the early hours of Friday, September 25. In London there was a very rapid fall in the barometer, followed by an equally rapid rise. In Ireland the direction of the wind was northerly, and in the western part of the Channel westerly. In some places extensive floods are reported.

THE AMERICAN AGRICULTURAL BUDGET .-The total amount set forth in the Appropriation Act for the United States Department of Agriculture for the fiscal year ending on June 30, 1897, is 3,255,532 dols., or more than £650,000 sterling. Taking some of the items which apply to horticulture and agriculture especially, we find the largest is 883,772 dols. for the weather bureau, followed by 750,000 dols, for the agricultural experiment stations, and 729,440 dols, for the bureau of animal industry. The sum of 150,000 dols, is assigned to the division of sceds, for the purchase, propagation, and distribution of such valuable seeds, bulbs, trees, shrubs, Vines, cuttings, and plants, as are suitable for cultivation in the various parts of the United States. The division of statistics receives 145,160 dols., of which 10,000 dols. "may be expended in continuing the investigations concerning the feasibility of extending the demands of foreign markets for the agricultural products of the United States, and to secure as far as may be a change in the methods of supplying tobacco and other farm products to foreign countries.' The sum of 29,500 dols goes to the division of entomology, and the same amount to the division of chemistry. This is closely followed by 28,520 dols. for the division of forestry; 27,560 dols, for the division of biological survey (hitherto called the division of ornithology and mammalogy); 26,500 dols, for the division of vegetable physiology and pathology, " of which so much thereof as may be directed by the Secretary of Agriculture may be applied to the investigation of Peach yellows, Californian Grape-disease,

root rot and blight of Cotton, Pear blight, and the diseases of Citrus fruits, and the remedies therefor; "23,800 dols. for the division of botany; and 22,500 dols. for experimental gardens and grounds. The division of agrostology receives 18,100 dols., and the division of soils 15,300 dols., both of these divisions muking their first appearance in an Appropriation Act. The division of accounts and disbursements gets 16,300 dols., and the division of pomology 12,500 dols.; 7,000 dols. go to the library, 5,400 dols. to the museum, and 5,000 dols. to fibre investigations. There also a sum of 15,000dols. is for nutrition investigations, with provision for co-operation between the Department and the experiment stations. Times, Sept. 28.

FLIXTON HALL.

This fine Elizabethan mansion (fig. 73), with its beautiful gardens and well-timbered park, the seat of Sir Hugh E. Adair, Bart., has long occupied a distinguished position in East Anglian landscapes. The park consists of about 500 acres, and has quite recently been largely added to, thus linking on the fine old timher to the modern groups, belts, and clumps that first meet the visitor's eye on entering the park from the Hammersfield Lodge. These groups, which are mostly planted with the Black Austrian Pine, Pinus Larieio, Larches, Spruces, &c., have, under suitable cultivation and timely thinning, developed into goodsized shapely trees. Most of these belts and clumps of young Firs and other trees are lighted up with a fringe of Laburnums, Cratægus in many varieties, and other flowering trees and shrubs, which greatly add to the effect by contrast with sombre-hued Firs, while hardly interfering with their growth and uses as screens and shelter.

The older portions of the park abound with fine timber, chiefly Elm, Beech, Sycamore, spreading Horse-Chestnuts, the latter in magnificent blossom at the time of my visit; and Oaks of magnificent stature, and clean straight boles. On the north side of the mansion, which has recently undergone extensive alterations, including a massive facing of stone, an avenue of enormous Sycamores, planted in double lines, evidently of great age, extends for more than half a mile. Its width is 60 yards, and this avenue afforded a welcome retreat in such burning weather as that of the past summer. Near the avenue stand some notable specimens of Pinus ponderosa, 60 to 70 feet high, the remains of a large number that have been destroyed by the gales to which East Anglia is peculiarly subject. numerous Oaks at Flixton are magnificent specimous of a fine quality of timber. On the land lying between the mansion and the home farm, sufficient timber might be found to rebuild the British navy on the old lines, should the whirligig of fashion ever again commit our national defences to wooden walls [!], and the owner be found willing to devote his Oaks to such patriotic purposes. It would seem that a long line of proprietors have regarded the Oaks at Flixton in the light of much-prized heirlooms, excellent in their way for enriching and adorning the estate. Tho present owner, who is in his eighty-first year, has entered with extraordinary zeal and energy into the improvement of the mansion, the gardens, and the estate generally; but, so far as could be learnt, no improvement must involve the sacrifice of a single Oak out of the many thousands that exist there.

Within the pleasure-grounds there stands alone a very notable Oak, which forms the boundary of three parishes, which at one yard from the ground measures 16 feet in girth, and is fully two centuries old. Near this is one of the finest plants of Berberis vulgaris ever seen by the writer. This grand old hardy shrub has been uprooted from many a copse and hedgerow, on the strength of a statement that it forters the spread of mildew. This is the more to be regretted as we have few shrubs that are more beautiful in tender leafage, in blossom, and in its drooping bunches of berries, and bronzy foliage in the autumn. A fine Mulberry tree of probably 300 years old forms another interesting link with old times; although many of the so called new creations, of which a newly-built retaining wall, nearly three quarters of a mile long enclosing the gardens and grounds, are others.

The plunning, re-arranging, furnishing, and planting of the gardens at Flixton reflect much credit on all those who are concerned in them, namely, Sir Hugh and Lady Adair, and their talented gardener, who has been at Flixton for about twenty-six years. Sir Hugh, while taking an interest in all branches of gardening, is specially partial to coniferous trees; and I noticed some nice specimens were getting up of Abies Pinsapo, A. bracteata, A. Webbiana, A. Veitchi, Pious Cembra, P. excelsa, Libracedrus decurrens, Cupressus Lawsoniana, C. L. var. lutea, Sequoia gigantea, Cedrus Libani, and Abies Douglasii. Among deciduous trees and thrubs were Acer Leopoldi, A. Negundo foliis variegata, Prunus Pissardi, purple leaved Birch, Cytisus Laburnum, Crategus of various species and varieties, l'ersian, white flowered and other Lilacs; golden-leaved Privets, as standards and as bushes. Several beds of Rhododendrons have been planted; and the dividing walls of the garden are well clothed with Roses, Clematis, and other beautiful plants, as well as with the too-seldom-planted Berberis stenophylla and Cotoneaster Simon-ii.

At the end of May last the bulbs, which had flowered in the geometrical and other parteres, were mostly in the sere and yellow leaf, and the summer bedding-plants were not yet planted. But in the herbaceous perennial borders, in which Lady Adair takes great interest, a capital collection of healthy plants in great variety was observed, notable among which were those welcome plants Alyssum saxatile, Phlox prostrata, and Iberis sempervicens, early-blooming Delphiniums, and Preonies.

Two handsome conservatories are attached to the minsion, and these were well furnished with large specimens of Camellia japonica, Lapageria rosea, and L. r. alba, Orchids, some very choice Gloxinias, and a magnificent Eucharis grandiflora, Begonias, and numerous other subjects. The plant-stove was filled with a capital collection of the older favourite tropical plants, together with numerous others of modern introduction. These stove-plants are very successfully cultivated, and I remarked good examples of Allamanda, Rondeletia, Franciscea, Mayenia erecta, Mediuella magnifica, Croton, Dracana, Gardenia, lxora, Clerodendron fallax, C. Kæmpferi, besides foliage plants, and some remarkably fine specimens, smothered in bloom, of the beautiful and fragrant Tabernæmontana coronaria.

A choice, if small, collection of Orchids is being got together, and quantities of Chrysanthemums, Salvias, Carnations, and other flowers are also grown for decorative purposes. Miss Joliffe and Winter Cheer being the varieties of the Carnation grown in the largest numbers.

Tea Roses have here what they deserve in every good garden, a house to themselves, where under proper treatment, and a tentative kind of pruning, which consists of the hard cotting-back of each shoot as the flowers are removed, a continuance of bloom from November to May, or even longer if such he desired, is obtained.

Surrounding the mansion and pleasure grounds is a large piece of ground enclosed with ornamental wire fencing, largely used as a nursery for such Conifers as Pinus austriaca, P. Laricio, Cedrus Deodara, C. atlantiea. Abies Dinglasii, and many others. Grapes are remarkably well done at Flixton, as are also Peaches. Nectarines, Cucumbers, Melons, Tomatos, &c. A good many thousand bedding plants are employed in fornishing the geometrical parterres, and as material for tilling vacant spots in the herbaceous borders. About six years ago a new kitchen-garden, of about 2 acres. was hid out at some considerable distance from and entirely out of sight of the mansion. This was fully furnished with promising crops of vegetables, while the walls, and the borders alongside of the chief walks, were planted with fruit trees trained in a variety of methods. The borders on each side of one of the central walks are planted with pyramidal Apple trees of nice shape, which are well cropped; espalier Apples and pyramidal Pears occupying a corresponding position on each side of another walk. The walls are being rapidly furnished with carefully trained Peach, Nectarine, Apricot, Pear, Cherry, nd Plum trees. The somewhat heavy soil suits all

sorts of fruit remarkably well. By the simple expe dient of planting different kinds and varieties of fruit on a variety of aspects, Mr. Fisher speceeds in improving the quality and extending the season of many of the Pears and other fruits. The varieties of Apricots mostly grown at Flixton are the Shipley, Roman, Large Early, and Kaisha. The older varieties of those of the Peach and Necturine are those chiefly grown. A part of the south wall is occupied by Marie Louise, Beurré Diel, B. Rance, B. Hardy, Huyshe's Prince Consort, Dovenné du Comice, and Ollivier de Serres Pears Some part of the west wall is planted with such Pears as Winter Nelis, Beurré Sterkmann, General Todleben, Williams' Bon Chrétien, Josephine de Malines; while Clapp's Favourite, Thomson's and Bergamotte d'Esperen are grown on the wall facing east; and Williams' Bon Chretien and Beurré Giffard on the wall facing north. Cherries and Plums are also planted on north and east walls. All of the Pears are worked on the Quince stock, and they are models of good training, and very fertile.

Gooseberries, Currants, Raspberries, and Strawberries were of great promise this season; and while the bolting of Cabbages was a common occurrence. it is worthy of note that of the two popular varieties, Ellam's Early and Enfield Market, grown side by side, not one of the first, nor many of the second bolted. The walks in the kitchen garden are edged with the blue Staffordshire tiles, and the coping of the walls with the same kind of material is as unique as it is effective. Flat tiles projecting as eaves about 6 in. from the top of the walls materially help to ward off frost. The water supply of the gardens is abundant, pipes and hydrants being found in almost every part of them. I would add, in conclusion, that in these days of agricultural depression when so many private gardens are being starved, it was refreshing to meet with a gentleman of the olden time who willingly affords every possible assistance to his talented gardener, Mr. Harry Fisher, in the making and improving of the garden. Mr. Fisher 1 am proud to say, was one of my first pupils in East Anglia, D. T. F.

HOME CORRESPONDENCE.

HEDGEHOGS.—It would be interesting to know if any of your correspondents have proved that hedgehogs will eat the large beetles that infest most Orchid and other warm plant-houses. We have found them to do so, when live beetles were put into a covered box with the hedgehog. We have had two of these animals in our Orchid-house for some time, and were led to try the experiment by perceiving when looking round of an evening that the beetles got fewer in number, II. J. C.

PERENNIAL ASTERS AS POT PLANTS .- It may appear to some almost absurd to suggest that Michaelmas Daisies make good and useful pot-plants, and yet they do, as Mr. J. Hudson is showing in Gunnersbury House Gardens at the present time. Having a fairly good collection, he thought he would strike cuttings of some of them in the early part of the summer, and having a bed of soil in a frame, he placed them therein until they were rooted, and then potted them off, placing three or so in a 32-sized pot, and then plunged them among the plants in one of his Strawberry beds. These struck plants are now growing nice heads of bloom, and as a matter of course they vary in height according to the height to which the variety grows. These miniature plants are the variety grows. These miniature plants are coming in very useful just now to replace in the borders the annual Asters, which have gone down sadly before the rains, as they invariably do, being only fair weather subjects. But some of the dwarfergrowing sorts are in the plant-houses, and one especially, named l'atulus, is truly charming, the plants from 6 to 9 inches in height, and having, for their size, quite large heads of bloom, looking like miniature Cinerarias. Some knowledge of the varieties is necessary in order to select those having the largest and fruest colours, these being the more effective. The height at which the variety grows does not so much matter, because they come in useful in mixing with other plants, and some of the taller forms would mix well with Chrysanthemums. R. D.

SWEET PEA CUPID.—"A M.'s" experience of this new Pea is similar to my own. Outside it has been a complete failure round here, all the flowers dropping off before opening. Under glass it was a success, which leads me to believe that the climate of Scotland, so unlike the country of its origin, is too cold and damp for its development. It would be well if others who have grown it would record their experience, so that both buyer and seller may be on their guard. Michael Cuthbertson, Rothesoy.

PELARGONIUMS AND BEGONIAS.—"An Old Hand" was, no doubt, in a satirical mood when he wrote on this subject in a recent issue. If written since the heavy rains began, he must have been highly favoured if Pelargoniums gave better bloom than Begonias. I have rarely seen the former so thoroughly demoralised all through the month of September as this year. On the other hand, Begonias have, amongst ordinary bedding plants, been almost the only ones affording bloom. No doubt Begonias will be employed for bedding purposes much more largely in future years, especially since they can now be purchased as dry tubers at reasonably cheap prices. If sweet-seented plants are desired, would not a number of handsome cut-leaved Cape Pelargoniums, planted thiuly on a carpet of Musk, or of dwarf Heliotrope, give all that was desirable! Such beds would suffer very little indeed in a wet autumn such as we are now experiencing. 1. D.

A NEW IDEA IN ORNAMENTAL GARDENING. -

The above heading may appear sensational, but however new ideas, useful ones and otherwise, from time to time suggest themselves to the mind, and peoples' tastes vary so much; moreover, novelty is sought with such earnestness in these days that a little divergence from the old time may be pardoned. Hobbies are carried to such an extent in horticultural and other pursuits, that I venture to make public the following suggestion. Some people spend thousands of pounds on Orchids, some their hundreds of pounds on rockwork or American gardees, but I think my garden would prove more interesting, more beautiful, and less expensive in maintenance than any of the above. Of late I have visited many private gardens and nurseries, and have been so delighted with the flowering shrubs and trees, and also with the variegated varieties of some, that I am convinced a garden consisting exclusively of flowering trees and shrubs, both evergreen and deciduous, and a garden of variegated and handsome foliage, berried trees and shrubs, would be most enjoyable. I was struck with the beauty of a large Gum-cistus bush, some 12 feet high, which I recently saw at Portsmouth growing in a small garden. In nurseries there are many specimens of such species, and a few larger ones. Until some trees and shrubs have attained a considerable size, their beauty is not developed; take, for instance, the Venetian Sumach, the Judas-tree, the Acers, or the Tulip-tree, &c. How beautiful this season have been the Golden Elder, the Acers, doubleflowered Thorns, Almond, &c.; and now in the autumn the bright searlet and yellow berries of the Mountain Ash. In recalling to mind some of the nooks contained in some of the more extensive gardens of which I have had charge, I remember a visitor's surprise when a mass of Gueldres Rose, Pyrus, Berberis Darwini, Lilac, &c., came suddenly into view, although they had passed without notice the same kinds of shrubs and trees before amongst other evergreens. Now a garden planted entirely with flowering trees and shrubs, and another one containing species with variegated and coloured foliage, with berried trees, &c., I think, would be charming and interesting. There would be something to and interesting. admire each day in the year, from the common Gorse and Broom to the stately Magnelia. Some of the most telling I would plant in groups to produce effect, and others should occupy horders varied in shape, so as to form recesses, prominent positions, and curves, and others again as single specimeus. A garden of some 4 or 5 acres or more, tastefully laid out and planted in the above manner, would have a grand effect. There are very many suitable places to be found in some large establishments for such a garden. Many gardens possess an arboretum and pinetum, the former interesting, the latter stately and pleasing, but both of them lack the daily variation that would be seen in the garden I propose. In some old disused kitchen gardens there are walls still standing, and at the foot of such many really be ritiful shrubs might be planted. The trees remarkable for their foliage or berries I would prefer to have by themselves in a separate garden. It was my intention to give a selection of such trees and

shrubs, but I found the list too extensive. I should like to see the above ideas carried out, and would feel a pleasure in assisting such an effort, if commenced with spirit. I would ask those who are apt to cavil at a new idea to well weigh these suggestions before they criticise them. We want more variety in the formation of gardens, and I have attempted to suggest a means of obtaining it. Edward Bennett, Queen's Road, Eyham.

CHASSELAS VIBERT.—In a house of Frontignan Grapes at Gunnersbury House, this variety, which apparently produces the largest bunches under glass, is also praised by Mr. Hudson as being a good outdoor variety. Amateur gardeners often enquire for a Grape which they can grow in a cold house, and in all probability Chasselas Vibert might meet their requirements. It lacks the high quality of Dr. Hogg, Grizzly Frontignan, and Chasselas Musque; but it is yet very pleasant to the palate—sweet and sprightly. Mr. Hudson said that, in a favourable season, the flavour of the fruit grown in the open air is good. R. D.

PROFESSOR J. J. KING.—As an old pupil of this worthy man, whose death will be deplored by those who knew him intimately, may I crave space for an eulogistic word or two concerning him. He was oue of Nature's gentlemen, genial and gentle, always ready to explain and go over the ground again and again to any of the students under his care; his face beaming with satisfaction when he found us interested and enthusiastic. In our botanical rambles in Clydesdale, o'er moor and marsh, or erag or torrent, ho was a most delightful companion. Simple in mauners, unaffected, and even careless in dress, he led our little forays by Bothwell Woods or through Camp-ie Glen, calling a halt now and then to demonstrate a fact or draw a comparison, and the student was, indeed, a dullard, who was not wiser at the end of the journey than at its beginning. Going through a clachan one Saturday afternoon, about twenty of ns, with our vasculums on our backs, Mr. King (who carried an extra large vasculum) was addressed by one of the yokels, and asked if he would give them a tune, yokels, and asked if he would give them a time, supposing that his botanical outfit was some kind of musical instrument. He once obtained for me from his brother, who, I believe, was at the time (in 1881) British Vice - Consul in Chili, some native Potatos of a species which had never been known to take the Potato disease. I sent them to a friend in Ireland for trial. The first year they escaped, slthough the produce was very unsatisfactory, but the second year a few diseased tubers appeared among them. When Mr. King was at Kensington in 1883, studying the higher botany, I paid him a surprise visit in the laboratory, and I can, in my mind's eye, now see the glow of pleasure that spread over his houest face when I appeared. Though fungi and mosses were his favourites, he loved botany in all its branches, and his death will be felt as a great loss to botanical students in the colleges in which he taught. Andrew

LATE POTATOS.-These, it is feared, will have suffered somewhat from the late rains, especially in low-lying districts, or where the soil is retentive. About Uckfield the erop is not, as a rule, so heavy as that of last year, although some of the varieties have turned out fairly well, with but very few diseased tuners. It seems to me that Potatos generally are not planted sufficiently early to enable the tubers to complete their growth before they are checked by frosts: hence the poorness of the crops. Growers well know that when the hanlm is cut down by spring frost, the crop is sure to be a light one; but if they could hit on that happy medium whereby injury in the spring, or at too early a date in the autumn, could be averted, yet planted in time to complete their growth while the soil was warm and dry, the tubers would doubtless be of a better flavour. With so much rain of late, the lifting of the crop cannot take place for some considerable time on stiff land, and it is to be feared that the tubers left in the ground will suffer. There are many varieties of Potatos in cultivation, and gardeners would do well to grow only the best. Those who have to meet a large demand need to grow such as give a good crop of fair-sized tubers, which is of far more importance to them than show varieties, whose evenness of outline is perhaps their chief recommendation. I fear that in the matter of judging Potatos at shows, the judges are apt to err on the side of mere appearance. Potatos, as a rule, in private establishments, are served up as dressed

dishes, and seldom plain cooked, and a fair-sized tuber finds most favour with the cook; and if this can be obtained of good quality, the gardener should etick to that variety till he has proved some others to supersede it. Many varieties in a season like the present were on poor ground too small to be useful, and were fit only for sets; while those of more robust habit that had not made their growth before the wet weatherset in have super-tuberated so much as to be worthless. Varieties of the Potato deteriorate to a considerable extent, and more so in some soils than in others; it is therefore always advisable to obtain a change by procuring the desired varieties from fresh growers. Of the thirty varieties grown by me this season, Sutton's Flourball was best. They were planted on March 24, and lifted on September 8, that is before the moisture in the soil had time to do any serious damage; in fact, the soil beneath the roots was at the time quite dry. I plant all of the strong growers at 3 feet apart, so that the ridges are wide. The crop of the variety menwas excellent, and most of the tubers, of which there from fifteen to twenty at a root, weighed about half a pound each, which would give more than thirty tons to the acre. They are of superior quality. Next to Flourball came Windsor Castle, also excellent, and the same may be said of Supreme, Trinmph, Snowdrop, Marvel, Robust, The Garton, and Schoolmaster. The question is often asked, if whole or cut sets produce the best crops. My belief is that there is a great advantage in planting whole sets, as the weight of sets per acre is much less if they are selected of an even size; but, as a rule, little care is taken in selecting them, or to prevent growth being made before planting. I am strongly of the opinion that the amount of soil drawn up to the stems has much to do with the weight of the crop, as those which are planted shallow and have but a small quantity of soil drawn up to them were not nearly so good, or the crop so heavy, as those to which a greater amount of soil was afforded. This may, I think, be easily accounted for in a season like that of this year, with a light rainfall during the summer. With the wide deep ridges the drought affected the plants in a lesser degree. are, moreover, various advantages in the autumn preparation of the land which is to carry l'otatos, more moisture being retained in it than if springdug or ploughed. Farmers, as a rule, do not take this into consideration, hence the reason so many of them fail to get good crops. In most gardens the quantity of l'otatos grown is limited, the main supplies being grown elsewhere, but the tubers do not usually give satisfaction to the cook, being uneven in size and mis-shapen, or they are too small when put into store, should never be covered with hay or grass, H. C. Prinsep.

A HORSE-CHESTNUT TREE IN FLOWER.—As one of the vagaries of the present season, it may prove of interest to put on record the fact that at the present time, facing the roadway, and in the grounds in front of "The Chestnuts," Chiswick, is a fine Horse-Chestnut tree in flower. It is practically denuded of its foliage, but here and there some belated leaves have pushed forth. The tree thus presents a strange aspect, the bare branches showing up the birds' nests scattered about the tree. This strange occurrence is doubtless due to the wood and buds having been well ripened early in the summer, and the development of a few of the latter has been hastened by the rainy weather lately experienced. According to the statement of an old inhabitant of Chiswick, this is the third time that this particular tree has flowered in this way. J. B.

DELPHINIUM ZALIL. — The engraving of this plant in the thardwares' Chronwele, p. 247, leads me to inquire of others their experience regarding its duration in gardens in this country. In the description of its character in the Transactions of the Linnwan Society, quoted in the Gard. Chron., at p. 248, appear the words Herba perennis. Judging from several plants I raised from seed sown in 1894, and which bloomed in 1895, I think it is only a biennial in this country. This is unfortunate, if correct, as the pale yellow flowers look rather pretty, especially when a short distance from the observer. The spikes vary considerably in density of flowering, and the one drawn on p. 247 appears to be an exceptionally fine one. The plants do not appear to be so liable to injury from slugs as those of D. nudicaule. S. Arnott, Carsethorn, Dumfries, N. B.

MAIZE AS A VEGETABLE.—I grow Maize with success, and it is easier to cultivate than Cabbages.

Instead of raising the young plants in heat and coddling them in pots till the weather gets warmer, I sow the seeds in the open in the last days of April or first in May, which I find gives the best and earliest results. The only difficulty that I find is in selecting the cobs for cooking. Either hard or very soft corn will not do, but something between the two. The varieties I grew this year are in their order of coming into use. Sutton's Early Dwarf Sugar, August 1; Golden Dewdrop, August 17; Cobbsts, August 18; Early Six Weeks, August 24; Yellow Canada, September 1; Country Gentleman, September 10; and Large Flesh Colour, September 20. The first two or three varieties could be grown as a field crop in selected warm soils or situation in the warmest parts of the southern counties. But I do not write from experience of Maize as a field crop in this country; it ripens so freely in the open garden here, that I think it would do so in a field, where by being sown in bulk, the plants would shelter each other. enclosed are samples cut to day, not the ripest, as they are used for consumption as fast as they become ready. [Excellent—En.] Geo. Abbey, Jun., Avery Hill, Eltham, Kent.

- It would be helpful in relation to the discussion that has arisen concerning Corn-cobs, if Mr. P. M. Veitch will tell us how his cobs when gathered, are dressed, and sent to table, and how consumed? I have been of opinion that the method of sending to table and consuming them does not meet with the approval of the English people, at home at least. Oddly enough, but a week or so since, there came to hand a letter from the extreme Northwest of Canada, in which these mealies are referred to. The place is so far north that the temperature goes down to 30° below zero in winter, hence is far from being an ideal climate. The letter is dated September 4, the writer referring first to garden produce, says: "If it still keeps warm and dry we shall have Vegetable Marrows to eat in a few days, also some Cucumbers, and the Tomato-bines are loaded with green fruit. I do not care so much if they do not ripen, as I use the green fruit to pickle, it helps to make fine chow-chow (whatever that may be). We had our first feed of 'sweet coro' yesterday, and it went fine. I was saying it was a pity some one had not got a snap-shot to take my portrait, in the act of eating; there I sat holding an end of the Corn-cob in each hand, and biting off the corn. It is a rare trouble to get the corn off, as you cannot use knives and forks at all well for the purpose." Now, if it be absolutely needful to consume these Corn-cobs in this distressingly ungainly way at table, is it probable that their consumption will ever "take on" here. That seems to be the point. I would mention that in this instance, all the things named, Maize included, were raised from seed sown outdoors in May. A. D.

The best variety of Maize to grow as a vegetable in this and similar warm parts of the country is Adams' Early, synonymous with Extra Early Adams. It grows but 3 to 4 feet high, matures quickly, cobs of a good size, milkywhite, and fairly firm. Another good sort is Cory Early, which bears a reddish-coloured cob. There is a sub-variety of this one with a whiter cob. Manhattan will do very well in some years, but in a wet summer it grows very tall, and matures late. The Early Minnesota is said to be an early variety, but I do not know anything more about it. Adams' Early is the most suitable variety to grow for table in the West of England. Andrew Hope, Eceter.

PLANT NOTE.

MARIGOLDS AS WET WEATHER PLANTS.

The dwarf types of the French Marigold, and especially the Double French and the single-flowered Legion of Honour, make capital wet-weather plants. At the Royal Nursery, Slough, there are lines of the latter which have borne the drenching rains of the past few days without apparently affecting the brilliancy of the blossoms, for as soon as the rain ceases and the petals become dry, the flowers are as gay as ever. The chocolste coloured forms of the double-flowered French Marigold, with their compact blossoms, formed, as it were, of a number of circles of golden-brown-edged combs, and these, too, throw off moisture readily. While the annual Asters have a wretched appearance, the Marigolds brave the rain, and will continue to do so until destroyed by frost, R. D.

THE SEED TRADE.

AMERICAN SEEDS.—In connection with the exhibition now being held under the auspices of the London Chamber of Commerce to illustrate articles of everyday supply and demand in the British colonies, a startling fact is made prominent in the department devoted to farm and garden seeds, to the effect that the United States of America conducts nearly the whole of the trade in these commodities. I feel constrained on the face of such an announcement to ease my patriotic feelings, and whilst I am bound to admit there is some amount of truth in the statement, so far as it exists, so much the worse it is for our colonies that things in this direction should remain as they are.

An idea prevails amongst seedsmen in Australia, particularly those who cater for the retail trade, that American-grown seeds are preferable in their climate to those of English origin. (I mention Australia because it is there that the Americans find their best market.) They say our seeds are so full of moisture that they will not keep. Again, they maintain that we cannot grow many of the species adapted to their warm climate, such as are so largely produced in the United States; and, thirdly, that we are unable to compete in price—an important item, from their point of view, in these times of meretricious cheapness.

As to the existence of real American seeds, I have vet to learn that the United States is entitled to he called a seed-producing country in this sense, for if we except California, a fine State only just coming into prominence, I should hardly know in what directiou to go to find what could be justly called a seed farm proper. One or two of the old established Philadelphia, New York, and Boston houses may have good breadths of a few special things under growth, but they could not help admitting that a very large portion of their "stock in warehouse" was produced in other countries. There is no denying that their climate will grow Squashes, Water-Melons, pole, Lima, and wax-podded Beans, Tomatos, and Cucumbers, but most of the garden products which the British colonist wants, go into America from other countries. All their best garden Peas come from Canada; all their choicest Cabbage, Beet, Celery, Carrot, Spinach, Cauliflower, Radish, Turnip, Lettuce, Onion, Mangold Wurzel, and Swede seeds are produced either in England or on the Continent of Europe; and it was just the same with the choicest flowers. We grant that our elimate is a damp one, but if our home-grown seeds are properly harvested and treated they are the best the world produces, and will travel safely and keep as long as germinating seeds are expected to. Why is it so very many of the best families in the antipodes send regularly to England for their seeds? The answer is not far to seek.

It is hoped this brief communication will tend to correct the notion that all seeds obtained from America are American, when it is an admitted fact that the larger proportion of them are European in origin, and only one or more years older than if bought from the producing countries; and I strongly recommend our Australian friends to give this point their serious consideration. Agri.-Horti.

GROSS GROWTH OF WALL TREES.

A HEAVY rainfall after a long drought will cause fruit trees as well as other kinds of vegetation to make growth in the upper part of the crown to the detriment, in the case of fruit trees, of the lower branches, and especially is this the case with stone fruits and Figs more than other trees [because of the abundance of roots. Ed.], and it is not desirable to allow this growth to go on unchecked, as it tends to prevent the wood becoming matured. In Apricot trees this growth is often of good use, as when branches have died off from heat and drought, and other causes, and better than removal is a timely thinning of the older wood, so as to allow the new shoots to be laid in at an early date. Peach and Nectarine trees when old sometimes make a strong growth at a late part of the

season, which, if it can be widely spread over the tree, greatly helps to make a presentable show, and being afforded plenty of sunshine it readily matures. After all, I do not advocate the retention of very old shabby looking trees, preferring young and handsomer ones.

As regards the gross shoots made by young trees, these should be checked early; especially strong shoots proceeding at right angles to the wall, and emerging from the main branches, otherwise fore-right shoots, which, if allowed to grow to any length before removal, cause gamming, which is not conducive to the health of the trees. Trees which make much breast-wood, or fore-rights, should be root-pruned as soon almost as the crop of fruit is taken, lifting them right out of the soil and re-planting. A few years ago there were some young Plum-trees at Sion which gummed badly, and made very gross shoots, and these were lifted the third week in September, with the result that the wood now made is firm and short-jointed, the trees crop grandly, and gumming does not occur. In some cases it is sufficient to open out a trench at a fair distance from gross-growing trees, and cut through the larger of the roots, especially those that extend downwards. When filling in the soil, old mortar or burnt garden refuse, and ceal-ashes (not manures), should be incorporated with it, and brought close to the cut-root Plums go wrong from the failure of a crop of fruit, for nothing keeps growth in check like regular cropping, but frost sometimes ruins our hopes, and in such cases root-pruning or lifting are best, it being useless to use the knife on the hranches. Fig trees on walls grow very freely after periods of heat, the roots revelling in the warm soil, and no tree requires more timely attention to ensure tho ripening of the wood than the Fig; iudeed, I pay more attention to this than I would to covering up the trees in the winter, for if the fruiting wood be well ripened frost will do less harm, unless in winters like that of 18-1895. It is much better to use the knife freely early in the season than to crowd the shoots in July and cut away when the leaf has fallen, or when giving protection. Much attention to the ripening of the new shoots and the removal of gross-growing ones is required if good crops of figs are looked for. The remarks as to lifting and root-pruning as advised for young Plums hold good with Figs; indeed, more so, and there is no better season than the present for carrying them out, G. Wythes.

VEGETABLES.

VARIETIES OF PEAS FOR LATE CROPS.

MR. HUDSON is earrying out, in the gardens of Gunnersbury House, a somewhat interesting trial of late Peas. A trial was made last year on a small scale, and Peas were gathered fully one week earlier than this season, which Mr. Hudson attributes to the fact that the drought had the effect of checking the early growth of the plants, and on the change of the weather the plants made a vigorous growth, but no early blossom. Some of the dwarf varieties have grown much beyond their normal height, and they are still growing. A few varieties were sown on July 7, and among them Chelsonian, which is already 6 feet in height. It is a strong grower, and free from mildew, but late in producing pods; another season it would be best to sow this variety fully one week earlier. A good crop is now forming, which may produce usablo pods. Criterion, sown at the same time is quite 5 feet in height, and quite ten days earlier than Chelsonian, and it pods remarkably well. It is now fully 5 feet high, and growing freely. Prodigy is the earliest Pea, and the pods are almost ready to gather. It is cropping as well as in summer, for Prodigy is one of the best of summer Peas. Duchess is of the same type as Prodigy, but with not so large a pod, and not so desirable for late work. Autocrat, fine late Pea as it is, should have been sown one month earlier, in order to secure Peas in the first days of September. It is naturally a late podding Pea, and invaluable for exhibitions at the end of Angust. Some others were sown three days later, among thom William I., but this variety is not so early as Prodigy by about a fortnight. Sutton's Bountiful, sown at the same time, is a very good Pea for late cropping, as is also Sutton's A1, dwarfer in growth than the preceding, a little earlier, and certainly a capital variety for late crops; both are strong growers, and with, this year, scarcely a trace of mildew. Empress of India, another Reading variety, is a strong grower, producing well-filled green pods; and Early Giant in the same way is also a useful Pea.

In a more open piece of ground, William I., of which there were five rows, appeared to be as early as any of the others noticed, those being more or less under trees; but it had reached a height of 5 feet, and was carrying a good crop of pods. This and Sutton's Al were sown on July 20. The first-named had reached a height of 4 feet.

The trials showed that the best varieties for late crops, are Prodigy, Sutton's AI, Sutton's Bountiful, William I., and The Duchess. One lesson taught appeared to be that naturally early varieties are the best to sow successionally for late crops, and that they should be sown in the open on slightly-raised ground; and seeing there is a tendency in late Peas to grow beyond the average height, there should be abundant space afforded between the rows. R. D.

SOCIETIES.

ROYAL HORTICULTURAL.

BRITISH-GROWN FRUITS AT THE CRYSTAL PALACE. (See also p. 400.)

Thursday, October 1, and two following days.

The Schedule is divided into the following divisions:—Division I., containing fifteen classes for fruits grown under glass or otherwise; open to gardeners and amateurs only. Division II., containing seven classes, open to nurserymen only. Division HI., containing twenty-seven classes for fruits grown in the open air; open to gardeners and amateurs only. Division IV., containing eighty-six classes for single dishes of fruit grown in the open air; open to gardeners and amateurs only. Division V., special prizes for the best-fl voured dessert Apples and Pears.

The whole of the competitive classes are given below.

Division L.—Paults Grown under Glass or Otherwise Open to Gardeners and Anyteurs only.

The first class was for a collection of twelve dishes of ripe fruit, in not fewer than six kinds, nor more than one black and one white Grape, or more than two varieties of any other kind. There were three competitors, and the winner of the 1st prize, which also included a Williams' Memorial Medal, was Lord Harrington, Elass on Hall, Darby (gr., Mr. J. H. Goodacre). In this exhibit were very long bunches of Musett of Alexandria Grapes, of moderace quality only, being only average in colour, form of bunch, and size of berry; much better bunches of Alicante, good Pitmaston Duchess, and Beurré Hardy Pears, Risston and Cox's Orange Pippin Appl s, Golden Eagle Peach and Monarc's Plum, Countess and Hero of Lockinge Meloas, and Smooth Cayenne and Jamaica Pines; a good collection, but not qual to some we have seen. The 2nd prize divided Lady H. Somenser, Eastnor Castle Gardens, Ledbury (gr., Mr. Harris), from Sir Jos. Pease, Bart., Hutton Hall, Guisborough, Yorks (gr., Mr. J. McIndoe), who was 3rd; each of these excelled in particular dishes, but we could hardly follow the judges in the manner in which they awarded the prizes.

In the 'nd prize exhibit there were Madresfield Court and Muscat of Alexandria Grapes, both moderate in quality; smooth Cayenne Pine, Sutton's Royal Favourite Melon, good in size, but somewhat discoloured; also High Cros Hybrid Melon; Pears, Pitmaston Duchess, very fine; Apple, Woreester Pearma in; Peaches, Lord Paloierston and Nectarine Morello Cherries, Coe's Golden Drop Plums, and Brown Turkey Figs.

In Sir J. Pease's collection, the Foster's Seedling Grapes were decidedly weak, and Gros Maroc is hardly a first-class variety, but the two Pines were grand; Peaches, Sei Eagle and Exquisite were very fine; a pretty Golden Drop Melon; capital Washington Apples; and Pears, Nee-

sea ragic and Exquisite were very nne; a pretty Golden Drop Melon: capital Washington Apples; and Pears, Neetarines, and Plums of average quality.

The best collection of eight dishes was one from W. H. D'Arev, Esq., Stanmore Hall, Middlesex (gr., Mr. W. Tidy). He had oxcellent grapes of Muscat of Alexandria and Aln-wick Seedling, the Muscats being the most commendable. Peaches Late Admirable were even and good; there were Pears Louise Bonne of Jersey and Pitmaston Duchess, Apples, Ribston Pippin, and some excellent examples of Passiflora edulis. A seedling Melon of moderate quality completed the exhibit, There was one other competitor only, viz., Mrs. Wingfield, Ampthill House, Ampthill, Middlesex (gr., Mr. W. J. Empson). He had good Alicanto Grapes, but the Pears, Apples, Peaches and Plums were of moderate quality only.

GRAPES, &C.

Six distinct vericties, both black and white most be represented,—1st prize to Mr. Wm. Taylor, gr. to Chas. Bayer. Esq., Tewkesbury Lodge, Forest Hill, for an even set of bunches, weighty, and fine in berry, but a little wanting in colour in a few instances. Gros Maroe was large in bunch, colour weak; Trebbiano large, and well fin shed; Madresfield Court, good in berry, colour weak; Gros Colmar, extra fine in bunch and finish; Muscat of Alexandria, medium bunches, well coloured; and Alicante, well fin shed. Mr. Reynolds, gr. to Messirs. De Rothes mild, Gunnersbury Park, Acton, was a close 2nd, the bunches not so heavy, but the finish was good; the varieties were Gros Maroe, extra fine berries. Muscats, well formed bunches, good in colour; Alicante, large bunches; Madresfield Court, well ripened and coloured; Buckland Sweetwater, well coloured; and Aliwick Seedling, good in bunch and colour. Mr. Goodacre, gr. to Earl of Harrington, Elvaston Castle, Derby, was 3rd, coming up close; his best being Muscat of Alexandria, Mrs. Pince's Muscat, and Mrs. Pearson, all first class exhibits, the bunches of medium size.

Grapes, there distinct varieties, two banches of each,—The 1st prize was awarded to Mr. W. Tavlou, gr. to Alderman Chaffin, Bath. The bunches were large and well ripened, Muscat of Alexandria well coloured and large in herry; Madresheld Court, large but rather weak in colour; and Gros Marce, extra infinish and size of herry. Mr. F. Haanes, gr. to Lady Herrary Somerser, Ledbury, was find with smaller bunches; Gros Colmar was here shown in the best possible condition, the bunches large, the other kinds being Gros Marce and Muscat of Alexandria. Mr. F. Cole, gr. to Sir Gro. Russell, Rt., M.P., Reading, came third with a good exhibit, the Muscats being extra fine, and the Black Hamburgh's good.

Black Hamburghs, three braches.—1st, to Mr. W. TAYLOR, for well-kept bunches, a little weak in colour, but good for the season; 2nd, to Mr. Mitchell, gr. to F. W. FLEMING, Esq., Chilworth Manor, Rousey, who had two extra large bunches and one smaller, but the three were better in all other points than the first award.

Madresfuld Court, three bunches - 1st, to Mr. W. Taylon, Bath, the bunches large, also berries, but the codour a little weak; 2nd, to Mr. W. Taylon, Forest Hill, the bunches smaller but the colour better.

Gros Column or Gros Maroc, three bunches.—1st, to Mr. W. TAYLOR, Bath, for grand bunches of the latter kind, finer than which in bunch, herry and colour, could not be desired—a grand exhibit. 2nd, to Mr. Gooda RE, for Gros Colmar, splendadly coloured and fine in herry.

Allocate, three branches — 1st, to Mr. W. Tidy, gr. to W. K. D'Aney, Esq., Stammore, the bunches and berries large, and the colour deep blue-black. 2nd, to Mr. W. Taynon, Bath. The bunches here were larger, but the fruit not quite so good.

Lady Donnes, three bunches.—1st to Mr. W. Tivy, who staged large well-coloured bunches with extra fine herries. 2nd to Mr. A. KEMr, Coelhurst, Horsham, the colour here being deficient.

Any other Black Grapes, - 1st to Mr. W. Tiny, who staged well-finished large bunches of Almwick Seedling. 2nd to Mr. W. Taylor, Ferest Hill, who had Gros Guillaume unusually fine in colour and berries, but small for the variety in bunch. 3rd to W. Mitchell, for Mrs. Pince Museat, extra fine in busches and well-coloured. To these latter the 1st prize should most decidedly have been awarded.

Museat of Alexandeia.—Ist to Mr. W. Tiffy, who had large bunches of good shape, the e-lours of the best, whilst the berries were large; 2nd, Mr. W. F. Cole, also with large bunches, well finished; 3rd, Mr. W. Lees, gr. to A. Beyan, Esq., Trent Park, who had the best coloured bunches of any, which were likewise heavy (a very strong class).

Any offer White Grapes.—1st to Mr. W. Taylor, Bath, who staged probably the finest three bunches in the show, in Cannon Hall Museat, the berries extra large and the colour deep amber (very fine); 2nd to Mr. Revnolps, who staged Foster's Seedling in admirable condition.

Figs, one dish of one variety.—There was only one exhibit, and this was from T. W. Erde, Esq., Liphook (gr., Mr. P. H. Edwards). The variety appeared to be Negro Largo.

Edwards). The variety appeared to be Negro Largo. Collections of Hardy Frait.—In the class for a collection not exceeding fifty dishes grown entirely in the open, the 1st prize was a Gold Medal offered by the Fruiterers' Company. This was withheld, however, in the discretion of the judges, and the 2nd prize only awarded to the exhibit from Mr. A. Wyatt, Hatton, Middlesex. This collection consisted exclusively of Pears and Apples, and the fruits, though many of them were of fair size, were less clean and attractive than they should have been, many of them being considerably dashed and damaged by wind, Lord Folly, Ruxley Lodge, Esher (gr., Mr. J. W. Miller) was 3rd, who added a little variety to the collection that was wanting in the other exhibit, by the inclusion of Walhuts, Medlars, and Quinces. Other hardy fruits, however, might and should have been shown, had the weather been more propitious, as the class was by no means limited to Apples and Pears, the only limitation being that the fruit should have been eultivated in the open.

In the collection for thirty-six dishes, grown partly or entirely under glass, there was much more interest. The 1st prize was taken by Sir J. W. Pease, who had Grapes, Buckland Sweetwater and Gros. Maroc, Negro Largo and Brown Turkey Figs, Neetarines Humboldt and Byron; Peaches Bellegarde Golden Eagle, Sea Eagle, and Exquisite; Apricots Moorpark (shrivelled); Magnum Bonum and Coe's Golden Drop Plums; Bryanston Greengage, and Late Duke Cherries. Of Pears we

noticed fine Beurré Baltet, Doyenné Boussoch, Doyenné du Comice, Pitmasten Duchess and Beurré d'Amanlis: Apples Bietingheimer Red, Grand Duke, Constantine and Maiden's Blush, &c. J. W. Miller, Esq., Sewardstone Ledge, Chingford (gr., Mr. J. Nicholson) was 2nd, and the only other exhibitor. The whole of the fruit in this collection had been grown on pot trees on a west border, with glass protection over head only. The exhibit tacked variety, consisting only of Apples and Pears as it did, but many of these were of very fine quality, though many of them were unripe.

DIVISION II.—NURSERYMEN ONLY.

The first class in this division, which usually brings out an exhibit of great attractiveness, was this year without an entry, viz, that for a collection of fruit trees in pots.

Collection of Hardy Freds grown partly under glass.—

Messis, G. Bunyard & Co. Maidstone. obtained 1st prize in this class with an excellent exhibit arranged on one of the square tables placed cornerwise in the transept. An Apple tree earrying a fine crop of fruit was considerably elevated in the centre, and this was surrounded by Grape vines, Fig trees in pats, and a few ornamental ber-pied plants, &c. On the flat part of the table were placed baskets and dishes of Pears, Apples, Grapes, Figs, &c., all of exquisite appearance and quality. Some of the more noticeable of the Apples were the following: Beauty of Kent, More de Ménage, Calville Ronge Précoce, Ribston Pippin, Belle Pontoise, Glora Mandi, Cox's Pomona, Lady Henniker, King of Tomkins County, Peasgood's Nonsuch, Sandringham, Fearn's Pippin, Cox's Orange Pippin, Wealthy, Akera, Lane's Prince Albert, Mother (American), Blenheim Or ange, Tibbet's Pearmain, Cornish Gilliflower, Bismarck, Rosemary Russet, Braddick's Nonpareil, Beauty of Kent, Emperer Alexander, Warner's King, and Giscoigne's Scarlet Seedling. Of Pears, we noticed the following: - Dovenné du Comice. Durondeau, Beurré Jean Van Geert, Marie Benoist, Gilogil, Conference, Marie Louise, Bearré Fouquerry, Bearré Clairgeau, Pitmaston Duchess, Bearré Dumont, Directeur Alphand, President Osmanville, Beurré Rance, &c. There were also Tomatos, Figs, &c

Collection of not fiver then 7% or more than 100 distinct varieties of Hordy Fracts, more entirely in the open air, — Here Messes, G.o. Bunyard were again the 1st, and only exhibitors. In the centre of the table was a square pyramid, formed of finely-coloured Apples, upon the top of which rested a large crown, composed of ornamental crabs and berries, with green leaves for a background. The table itself was laden with dishes of Apples, Pears, Grapes, Nuts, Medlar's Plums, &c. All the produce was very fine. Some of the Apples were arranged in cones, from the centre of which appeared a Croton or Dracena.

Collection of not fewer than therty or more than fifty distinct varieties of lacely fruits, grown in the open.—Mr. H. Benwick staged a very fine lot of produce in this class, and was deservedly list. There were Apples, Pears, Prince of Wales' Peaches, Almonds, Dansons, Coe's Golden Drop Plains, &c. We noticed particularly fine samples of the following Apples, The Queen, Coe's Pomona, Warner's King, Autumn Pearmain, Amne Elizabeth, Hoay Morning, Coe's Orange Pippin, Tyler's Kernel, and Ribston Pippin. The Pears were likewise of extra quality. 2nd, Mr. A. Wyati Hatton.

Collection of not forcer than there or more than fifty destinct Varieties of Apples. These were grown entirely in the open air, and were arranged on a table space of about 24 feet by 3 feet. The schedule allowed foliage plants to be added, and branches of any fruit-bearing trees or bushes; none of these branches of any fruit-hearing trees of ousness; none of these was used, however, by the exhibitors. The 1st prize was taken by Messrs. Geo. BUNNING & CO., Maidstone, who staged fifty dishes and baskets of very choice fruits staged fifty dishes and baskets of very enoice trints. Some, indeed many of the varieties, were represented by very large specimens, and the colour of the greater number was exceptional. The Queen, Gold Medal, Striped Beefing, Peasgood's Nonsuch, Waltham Abbey Seedling, Beefing, Peasgood's Nonsuch, Wattham Abney Seedling, Bowhill Pippin, Lord Grosvener, Cel lini Pippin, Tower of Glamis, King of Tomkin's County, Hambling's Seedling, Twenty Ounce, Stirling Castle, Wealthy, Tyler's Kernel, Castle Major, Ecklinville, Mere de Menage, New Hawthorn, den, Murits Seedling, Worcester Pearmain, Lord Derby, Beaumann's Reinette, Gloria Mundi, Cox's Pomona, Mrs. Barron, Lady Henniker, Warner's King, Newton Wonder, Lawry's Cornish Giant, Graham's Royal Jubilee, Grenadier, Hormead's Bismarck, Bramley's Seedling, Pearmain. Gascoigne's Scarlet Scedling, Pott's Scedling, Bietingheimer, Alexander, Winter Ribston, Stone's or Loddington, Golden Spire, Lane's Prince Albert, Foster's Seedling, Washington, Belle Pontoise, Manx Codlin, Lord Suffield, Farmer's Seedling, and Golden Noble were the varieties included, and they formed a very fine collection of varieties; 2nd, Mr. JNO. In this collec-Fair Oak Gardens, Bassaley, Newport, Mon. tion there were also some very fine dishes of fruit.

Collection of not fewer than thirty, or more than fifty distinct

Collection of not force than thirty, or more them fifty distinct varieties of Peors, grown entirely in the open air.—No decorations were used in this class either, and the 1st prize was again taken by Messrs. Geo. Bunyard & Co. The varieties were, Souvenir du Congrès, Conference, Poire d'Anch, Madame Chandy, Grosse Callebasse, Brockworth Park, Zephirin, Gregoire, Emile d'Heyst, Marie Benoist, Princess, Doyenne du Comice, Baronne de Mello, Duchess d'Angouleme, President d'Osmanville, Comte de Flandre, Beurré Baltet, Pére Glogil, Beurre Jean Van Geert, Brown Beurré, Beurré Fonqueray, Pitnaston Duchess, Br.om Park, Beurré Bachelier, Fertility, Beurre Clairgeun, Duchess de Bordeaux, Vicar of Winkfield, Madame Andre Leroy, Marguerite Marrillat (fine specimens of a new Pear), Conseiller de la Cour, Beurré Benoist, Vinense, Durondeau, King Edward,

New Hawthornden —Ten dishes.—Ist, Mr. Woodward, who,

however, bud two weak fruits; 2nd, Mr. HERRIN; 3rd, Mr. biwis.

Hormonds Proximain. - Three dishes only. Ist, Mr. McKenzie; 2nd, Mr. Woodwynd; 3rd, Mr. Startup.

Lane's Prince Albert, Seventeen lots. A fine collection. 1st, Mr. C. Ross, with superb samples; 2nd, Mr. Sage; 3rd, Mr. Woodward,

Lord Derby.-Nine dishes. 1st, Mr. WOODWARD; 2nd, Mr. SAGE; 3rd, Mr. STARTIT

Land Grossenor. Only two dishes, and but one good, from Mr. Woodwien; Mr. Salmon, of Chester, getting 3rd. Land Saffidd.—Four dishes. 1st, Mr. Woodward; 2nd, Mr. Starter; 3rd, Mr. Lewis.

Mere de Menage. -Some superb fruit being she Mr. Turton; 2nd, Mr. Woodward; 3rd, Mr. Ross. Some superb fruit being shown. 1st,

Newton Wonder,-Six dishes 1st, Mr. Hudson; 2nd, Mr. Harris, gr. to - Perowley, Esq., Croydon; 3rd, Mr. Lewis.

Peasgood's Nonsuch. 1st to the Horticultural College, Swanley, principal Mr. F. G. Powell; this exhibit was weighty, and finely coloured, being fully ripe; 2nd to Mr. J. MORTER, Upper Norwood, as large, but not so uniform as the preceding; 3rd to Mr. J. McKenzie, also a grand dish. Ten exhibits.

Pott's Seedling .- Ist to Mr J. H. Salmon, the fruits large, but rather uneven; 2nd to Mr T. W. STARTUP, West Farleigh, whose exhibit was more uniform, and of better colour, but not so heavy. Six exhibits,

Royal Jubilee. 1st to Mr. G. WOODWARD, who had a grand dish of well coloured weighty fruits; 2nd to Mr. C. Ross, whose fruits were of smaller size. Three exhibits.

Sandringham.-Ist, to Mr. O. WOODWARD, the fruits were well coloured, solid and weighty; 2nd, Mr. W. Slogrove.

Seaton House. The 2nd prize was awarded to Mr. Turton, who had a very good dish, but was the only exhibitor,

Spencer's Favourite,—1st to Mr. (1), Woodward, who showed

finely-coloured, deep yellow fruits, and in good condition the only exhibit.

Sticling Custle.-1st to Mr. W. H. BANNISTER, the fruits being large and weighty, extra good; 2nd to Mr. J. H. Salmon, who had another good dish of fruits. Five exhibits. Stone's or Laddengton Seedling.—Ist to Mr. G. Woodward, who had a grand dish of immense fruits, in every sense perfeet; 2nd to Mr. McKenzie, with smaller examples. Five

exhibits. The Queen.—1st to Mr. T. W. Starter, who had a dish of large, finely-coloured fruits; 2nd to Mr. G. Chambers, Mereworth, whose fruits were quite as large, but not so well

coloured. Seven exhibits. Tower of Glomes -1st to Mr. C. Ross, with a fine weighty

 dish_{+} 2nd to Mr. G. Woodward, whose fruits were almost equal to the winner. Six exhibits, Warner's King.—1st to Mr. J. McKenzie, who had very large fruits of extra weight, and clear in colour; 2nd to Mr.

H. C. PRINSER, who was last from point of size, Fifteen Any other Variety.—1st to Mr. W. Mancey, Merstham, for well-coloured Hollandbury its only recommendation at the

best; 2nd to Mr. McKenzie, for a grand dish of Gloria Mundi, quite the best exhibit in this class; 3rd to Mr. G. Woodward, who staged Waltham Abbey Seedling, this dish also was much better than the 1st prize. Twenty-six exhibits.

DESSERT PEARS

Bergamotte d'Esperen. - 1st, to
Mr. A. Basil, gr. to Rev. O. S' Powell, Weyloridge, the fruits large and weighty—a tine

dish; 2nd, to Mr. W. Jones, gr. to J. R. Brougham, Esq., Carshalton, who also had a line dish. Nine exhibits.

Beurré Bosc. - 1st, to Mr. Andrews, Campsey Ashe, Wickham Market, the fruits were large, but lacked colour; 2nd, to Mr. J. Hill, gr. to R. W. ADEANE, Esq., Cambridge, with riper fruits. Six dishes, and one dish of Deyenne du Comice under the name of Beurré Bose.

Bewre't Diel.—1st, to Mr. G. Wythes, gr. to Earl Percy, Syon House, who had by far the best dish, selendid clear fruits of large size; 2nd, to Mr. G. WOODWARD, whose dish was also of first-class quality. Sixteen exhibits.

Beurre Dumont .- No exhibit was shown true to name; two were staged-one of Beurré Rance, and another of President Osmondville; evidently there is some confusion in this Pear.

Bearre Hardy. - 1st, to Mr. G. WOOLWARD, who had a superb dish of ripo fruits; 2nd, to Mr. Andrews, who had a smaller set of fruits. Nine exhibits.

Beurre Superfin. -1st, to Mr. G. Woodward, with an equally

fine dish to that in the preceding class. Eight exhibits.

Confirence.—1st, to Mr. J. Nicholson, gr. to J. W.
MELLES, Esq., Chingford, for a dish of uneven fruits, some

very good. The only exhibit,

Conseiller de la Conc.—1st, to Mr. A. Basile, with good samples; 2nd, to Mr. W. F. Bannister, for a good dish. Six

Emile d'Heget. -1st, Mr. G. Woodward, with a remarkably fine dish, bright and even; 2nd. Mr. Geo. Goldsmirit; and 3rd, Mr. A. Basile, gr. to the Rev. O. L. Powell, Weybridge.

Fondante d'Automne,-Three dishes were staged, and as There makes were staged, and as there was no trace of a 1st prize, it may be presumed it was withheld, Mr. Basile took the 2nd prize with a fairly good dish; and Mr. Geo. Goldsmith, the 3rd.

Glou Morceau -Of this variety there were fourteen dishes, Mr. G. Woodwarn taking the 1st prize, with a very dish; Mr. W. COTTERELL, Tonbridge, was 2nd; and Mr. C. W. Chard, Bygrove House, Clapham, was 3rd.

Easter Bearre -Of Easter Bearre there were to dishes, Mr. J. Powell taking the 1st prize with an excellent dish of fruits Mr. Woodward was 2nd with much larger but not so

well finished frui s, and Mr. W. Jones, Carshalton, 3rd. Davondeau.—Of this Pear there were 12 dishes of well ecloured examples, Mr. W. G. Pagnell, Sherborne Castle, was 1st, with a magnificent dish of fruit, large in size and superbly coloured. Mr. G. Woodward was 2nd with smaller superory coloured. Mr. G. Woodwarn was 2nd with smaller but highly coloured fruit, and Mr. W. Cotterell, 3rd Duchesse de Borleaux.—Of this there were 2 dishes, but

ene was disqualified and Mr. Geo. Gottswicht Horsham. as awarded the 1st prize for a fairly good representation of

the variety.

Doyennd die Comice.—Of this popular Pear there were 15 dishes, Mr. B. CALVERT, Bishops Stortford, being placed 1st with a very fine dish indeed. Mr. Woodward was 2nd, and Mr. R. Edwards, (gr., 11. Field., Sevenouks, 3rd.

Josephine de Malines,-Of this variety there were sixteen dishes. Mr. C. Ross, Welford Park, was 1st, with a nice, bright even dish of fruits of fine quality; Mr. Woodwand was 2nd, with fruit only little inferior; and Mr. J. Powerl, Dorchester, 3rd.

Louise Bonne of Jersey.—Of this there were fifteen dishes. Some very handsome examples being staged. Mr. J. Gibson, Chippenham, was 1st with fruits of very large size, though not well finished; Mr. J. BOWERY, Attleboro, was 2nd, also with very fine fruit; and Mr. T. Potter, gr. to P. WORSLEY, Esq., Cuckfield, 3rd.

Marie Louise.—Of this popular Pear there were sixteen dishes, the 1st prize going to Mr. J. Hill, Cambridge, for A grand dish of fruits; Mr. W. A. Cook, Caine, was 2ml, with larger fruist, but not so well finished; and Mr. J. Powert, 3rd.

Marguerite Marillat -Of this variety no examples were staged. Nouvelle Falvie. - Five dishes were staged, the 1st prize

heing taken by Mr. T. Spencer, gr. to H. C. Mortarr, Esq., a very fine sample; Mr. G. Warms, Syon House, was 2nd, and Mr. A. Bastit, 3rd.

Pilmoston Duches.—There was nineteen dishes of this

Pear, many of them very line. Mr. T. G. Powell, Horticultural College, Swanley, was 1st, with well coloured truits 2nd, Mr. W. Mannino, Upper Galton, Merstham; and ard, Mr. C. HARRIS, East Grinstead.

Seckle. -Oi this variety there were six dishes. Mr. C. Ross was 1st with well-finished fruits, Mr. B. Calvert, gr. to Col. ARCHER HOURLON, Bishops Stortford, 2nd; and Mr. J.

POWELL, 3rd.

Soucearr du Congrés. -- Of this variety there was only one dish—a very fine one from Mr. W. H. BANNISTER, Bristol
Thompsons.— Five dishes of this variety competed. Mr. F.

HARRIS, Eastnor Castle, was 1st, with fine well-rip fruit; 2nd, Mr. C. Ross; and 3rd, Mr. W. H. BANNISTER well-ripened

Triumphe de France. Of this variety there was no representative.

Winter Nelis.-Nineteen dishes of Winter Nelis competed. Mr. R. Edwards, gr. to G. H. Field, Esq., Sevenoaks, was 1st, with a dish of good-sized fruits; 2nd, Mr. G. Woodward; and 3rd, Mr. H. C. PRINSEP.

Any other Variety. -Twenty-four exhibitors competed in this class. Mr. W. DANDERS, Andover, was placed 1st with a grand dish of Duchess d'Angoulème; Mr. H. C. Prinser was 2nd, with the same variety; and Mr. W. Pore, Highelere, 3rd, with Marie Lou'se d'Ucele.

Division V.

This consisted only of two classes, one of which was a competition for the best flavoured Apple, and the other for the best flavoured Pear. This was part of a competition that will extend for a year, to be engaged in at every inceting of the Royal Horticultural Society from July, 1896, to June, 1897.

The prizes are furnished from a fund placed at the disposal of the Society by the firm of Messrs, Jas. Veiton & Chelsea. On this occasion, there were eighteen dishes staged, and the 1st prize was obtained by fine specimens Cox's Orange Pippin shown by Mr. H. C. PRINSER, Buxted Park, Uckfield; 2nd, Ribston Pippins, from Mr. T. W. STARTUP, West Farleigh,

From fourteen dishes of Pears, the variety's lected for the 1st prize was Thompson's, grown upon a bush tree, in southern aspect, in heavy loam, upon the Quince stock, in Kent; 2nd Beurré Hardy, from a wostern wall, the soil heavy loam, upon the Quince stock. Both dishes were shown by Sir WM. LEARY, Bt., Tonbridge (gr., Mr. W. Cotterill).

Gardeners' Luncheon.

Some fifty or sixty gentlemen were present at the gardeners' luncheon, which was presided over by Sir Trevor Lawrence. In giving the toast of "The Queen," the Chairman alluded to the fact that Her Majesty was not only a putron of the Royal Horticultural Society, but also a frequent exhibitor, and he added that in the present year espe they would drink the toust with the greatest enthusiasm. The toast having been duly honoure !-

The CHAIRMAN rose to propose the health of the Judges, who had been kind enough to give their services on the present occusion. The judging of fruit was, he said, an exceedingly difficult matter, and they would quite believe that when he told the n. on information which had just reached him, that in the present show a dish of Cox's reached him, that in the present show a dish of Cox's Orange Pippins had been awarded a prize as Ribston Pippins Laughter). He only mentioned it to show how exceedingly difficult the task was, and how indebted they were to the gentlemen who undertook such Libours and that without fee or neward. The Royal Horticultural Society are indebted in many ways to the professional gardeners of the United Kingdom, and the fact that very few complaints were forthcoming concerning the awards proved that the gentle-men who acted as judges held the highest position of authority. He thought they would agree with him, and having regard to the character of the season which had been very unfavourable, the exhibits were of a highly meritorious and satisfactory character. The same, however, to be said of the season in Italy. There they no There they suppose everything would be perfect, but he had just returned from the Italian Likes, and the vintages there would prove failures, as the Grapes were retting. What, therefore, could they expect in their own country, where gales and storms had prevailed. He hoped, however, that they would be able to satisfies the torly compete with the foreigner, who always intrided his fruit upon us. In conclusion he thunked the representatives of the Crystal Palace (Mr. Gillman and Mr. Gardiner who had done so much to make the show a success, and he coupled wit i the toast the name of Mr. Thomas, the Queen's gardener.

Mr. Thomas briefly responded. He said it was always a pleasure for gentlemen to undertake the work of pulging where there was such an excellent variety, because they themselves could learn many a lesson. Alluding to the exhibits, he observed that he did not mean to say there was a ifect banel, of the Museat Grapes (Alexandria) in the show, but some of the specimens he had seen more nearly approached that high standard than usual.

ALTRINCHAM AGRICULTURAL AND HORTICULTURAL.

September 24. - This is one of the great shows in Cheshire, held in the Park, Devesdale, Bowdon, where every department in connection with 1 and was represented. There were over 3,50) entries in all. The strictly-speaking horticultural produce was laid out in a large tent by itself, and the respective classes were well filled. If it for the best collection of horticultural produce was won by Miss Lordy, Ashton on-Mersey, comprising black and white Grapes, some Peaches and Necturnes, Apples, Pears, and such like, with a very good lot of vegetables, compaising Pumpkins, Carliflowers, The 2nd prize Onions, Potatos, Peas, Locks Carrots, &c. went to Sir F. Forens Adam, Lymon.

For six Drumhead Cabbagos, Mr. P. RALANDS, Thelwall, was 1st; Mr. PEARSON, Heysterd, 2nd. For three Savoys, Mr. Wu. R. Covle, Danham, Intla very superior Let, and so had also Mr. J. Brown, Dunham, and for three Red Cobbiges, Mr. T. Warburner was 1-t. Sir F. Forees Areau, 2nd For three Calliforners there was a large competition, and a

generally grand lot, chiefly of Autonou Gimt, Mr. C. Tit hog, Alteineban, 1st; and Mr. J. WALLER, Hale, 2nd.

For six Parsmys with tops on, Miss Loute was (st) and Messes, J. & F. Puarson, 2nd and 3rd.

For six Altrincham Carots there was a large competition, as we would naturally expect, Mr. J. Darbyshure. Timperley, 1st; and Mr. J. Huwitt, Hey Head, 2nd, the roots not heing so large, but clean and well shaped. Mr. JACKSON the three memier prizes for any other variety with Long Red.

The Potatos formed a large exhibition of themselves, and were generally of first quality, Mr. P. Davies, Warburton, and Mr. Pauker, High Peover, being 1st and 2nd with twelve e doured kidneys , and the former exhibitor winning easily with twelve white kidneys , the same grower having the best twelve round coloured, and the lest twelve white

For the best twelve Potatos of any variety introduced sin of 1805, Mr. J. R. Newton, Warburton, was 1st with Universal; Mr. E. CLARE 2nd, with Goldfinder

Obituary.

WILLIAM BROCKBANK .- The death of this wellknown Manchester horticulturist took place at his residence, Brockhurst, Didsbury, on the 25th ult., at the age of 66. Like his father, he became a surveyor and engineer, and in conjunction with his partner in business carried out many important works in surveying for railways, and in staking out new ones. In public matters Mr. Brockbank took a leading part, doing much in the direction of public education. He was a Governor of the Royal Institution, a Fellow of the Linnean and Geological Societies, and as a Member of the Manchester Literary and Philosophical Society he contributed many papers on botanical and geological subjects; among others, a full and detailed account of the section of earth exposed in the railway cutting between Levenshulme and Fallowfield, illustrated by diagrams of the strata, and showing the gradations from the Permian formation to those of the upper coal measures. Though in the immediate neighbourhood in which he resided he never sought official position, he yet exercised a considerable influence and interest is local affairs. In the matter of the water supply to the district, and in other things in which his personality was not seen, but on which largely the health and well-being of the people depends, Mr. Brockbank took an active although unobtrusive part. That he was often misunderstood was frequently apparent, but those who knew him best can have no hesitation in stating that under a somewhat austere exterior there leat a sympathetic heart. This was shown when he threw open his gardens and grounds for the enjoyment of those around him on Sunday afternoons; and though the privilege was abused to an extent which necessitated the withdrawal of the privilege, this latter step caused Mr. Brockbank considerable regret. He was buried in the grounds of the Friends' Meeting House at Ashton-on-Mersey.

To the readers of the Gardeners' Chronicle Mr. Brockbank will be known by his occasional contributions to gardening literature. Mr. Albert Mottershead, who was his gardener for the space of thirteen years, states that Mr. Brockbank was an ardent cultivator of hardy Alpine and herbaceous plants, and certain sections of florists' flowers, notably the Auricula and the Polyanthus.

The late Thomas Mellor named a grey-edged flower after him, and Mr. C. Turner, a fine alpine variety. He raised some fine gold-laced Polyauthuses, Black Cap and Black Knight in particular; and his Anriculas and Polyanthus were frequently seen on the exhibition table at Manchester, and occasignally in London. Primulas of all types found in him an ardent admirer and cultivator, and in his garden at Brockhurst he had every facility for growing these plants; the rockeries and rock borders were mostly built on a natural brow-side, which consisted chiefly of sand. He made a great hobby of Saxfrages, and raised seedlings, among them some very promising forms from McNabiana. Mr. Mottershead states he had an enormous number of species and varieties, He grew Narcissus largely also, and his experiments He grew Narcissus targety also, and also capable with them led him to the conclusion that it is possible varieties from seed. The sible to reproduce double varieties from seed. Hellebores and the Lencoium were also favourites.

A vigorous controversialist, Mr. Brockbank fremently appeared in print, and controversies in which part generally ended in some debatable subject being placed on a more satisfactory basis. He did much towards defining the various species of the Hellebore and Leucoium. Some two or three years ago Mr. Brockbank busied himself with experiments in the direction of endeavouring to alter the colours of flowers by the absorption of aniline dyes.

ENQUIRY.

" He that questioneth much shall learn much,"—But on,

PLAGUE OF COCKROACHES.—Will some experienced reader kindly inform "L." what can be done to exterminate a plague of cockrosches. What is the best terminate a plague of cockroaches. temedy after various trues, catching by hand, poisoning with arsenic in honey, with phosphorus in butter, and with the ordinary phosphor paste, have been tried and in vain. The insects still come in apparently and in vain undiminished numbers.

VARIORUM.

PRUNING FRUIT TREES IN ITALY.-The disadvantages arising from the failure of fruit trees to produce in successive years a uniform quantity of fruit are well known to all engaged in fruit culture, and information regarding any system of cultivation that has for its object the equalisation of successive crops, especially when it is said that such system has been successful, must be of interest to them. According to Consul Seymour of Palermo, with the view of equalising the crops in the Sorrentine Peninsula, it has been shown that good results bave been obtained from the following method of pruning. Prune conconsiderably after a scarce year, cutting away some of the fruit-bearing branches, and little after a full year. This system, though the opposite of the old, seems to be in theory the proper one, for it is due to the fact that during the loaded year the tree is deprived of nourishment that might be used by it next year in the formation of fruit; and by depriving the tree of the branches which only deprive it of fruit, there will be less nourishment required by the fruit in tho following year, and the tree will have more for the formation of fruit.

MARKETS.

COVENT GARDEN, OCTOBER 1.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.

SEEDS.

Lonnon: September 30.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report a strong and cheerful market; all descriptions of Clover-seeds, in consequence of the continued had prospects for the new crops, tend upwards in value. Alsike is 3s. up. Winter Tares keep steady. Rye is still searce. Higher quotations for Wisconsin Peas are cabled from America. More money is asked for English Blue Imperials. Haricots are also in the ascending scale. Canary-seed distinctly favours holders, an enriy and substantial advance being confidently expected. There is no alteration in either Mustard or Ragesed. Some choice Fenugreek is now obtainable at tempting figures.

FRUIT AND VEGETABLES.

LIVERPOOL: September 30.—The following are the latest markt quotations:—Potatos, 8d. to 10d. per peck: Asparagus, 3d. per 100; Cucumbers, 3d. to 6d. cach; Daussons, ragus, 3d. per 100; Cucumbers, 3d. to 6d. cach; Dainsons, 1½d. per pound; Grapes, English, 2s. 6d. to 3s. per pound; do. foreign, 6d. to 8d. do.; Mushrooms, 4d. to 8d. per pound. North Haymarket prices; — Potatos: Giants, 1s. 8d. to 2s. per cvt.; Main Crops, 2s. 3d. to 3s. 6d. do.; Suttons' Abundance, 1s. 9d. to 2s. 2d. do.; Bruce, 1s. 10d. to 2s. 4d. do.; Cartons, 1s. 8d. to 2s. do.; Turnips, 6d. to 8d. per dozen bunches; Carrots, 6d. to 8d. do.; Onions, English, 5s. 6d. to 6d. per dozen bunches; Cartons ed., foreign, 2s. 9d. to 3s. do.; Parsley, 4d. to 6d. per dozen bunches; Cucumbers, 1s. to 2s. 6d. per dozen; Cauliflowers, 6d. to 1s. do.; Cabbages, 6d. to 10d. do.; Celery, 1s. to 2s. 3d. roll.

Olascow: September 30.—The following figures represent the averages of the past week's quotations:—Frail:—Pears, 2s, 3d. per case; Apples, 6d. per pound; Green Gagos, 5d. to 6d. do.; Tomatos, 4d. to 5d. do.; do., Scotch, 7d. to 9d. do.; Plums, 3d. to 4d. do.; Grapes, home, 2s. do. The districts indicated by number in the first column are

16 lollowing:—
O. Scotland, N. Principal Wheat-producing Districts—

 Scotland, E.; 2, England, N.E.; 3, England, E.;
 Midland Counties; 5, England, including London, S.
 Principal Grazing, &c., Districts—6, Scotland, W.;
 England, N.W.; 8, England, S.W.; 9, Ireland, N.;
 Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending September 26, is furnished from the Meteorological Office:-

"The weather during this period was very rough and squally, with frequent and heavy rain in all parts of the signature. Newspapers reported that sleet fell in some parts of Scotland on Saturday.

"The temperature was below the mean, the deficit ranging

The temperature was below the mean, the deficit ranging from 1° in some of the western districts, to 3° in 'Scotland, N. and E.,' and 'England, E.' The highest of the maxima were recorded, as a rule, on the 22nd, and ranged from 66° in 'England, S.' and the 'Midland Counties,' to 62° in 'Scotland, N.' and 'England, N.E.,' and to 61° in 'Scotland, W.' The lowest of the minima occurred on the 21st, when the thermometer fell to 31 in 'Scotland, E. and W., 'to 32' in 'Scotland, N' and 'England, S.W.,' and to between 34' and 37' in nearly all other districts. In the 'Channel Islands'

orth-eastern parts of the kingdom the fall was about twice, and in the western and southern districts about three times

as large as the mean for the time of year.
"The bright sunshine exceeded the mean in 'Scotland, N., and just equalled it in 'Ireland, N.;' in all other districts, however, there was a deficiency. The percentage of the possible duration ranged from 36 in 'England, S.,' and 35 in possible duration ranged from 36 in 'England, S.,' and 35 in 'England, S.W.,' to 21 in 'Scotland, E.' and 'England, N.E.,' a d to 17 in 'England, N.W.'"

NOTICES TO CORRESPONDENTS.

BOOKS: James Court. Elements of Agriculture, by Fream, published by John Murray, Loudon, price 2s. 6d. The Soil of the Farm, by J. Scott and J. C. Morton, published by Bradbury, Agnew & Co., 9, Bouverie Street, London, E.C. Agriculture: Practical and Scientific, by Muir, published by Macmillan & Co., Bedford Street, London, W.C.

Carnations: A. Cook. If the methods pursued differ from ours, kindly send a note on the subject, which we shall be pleased to publish.

CATTLEYA-FLY: J. C. We should certainly recommond the use of Richards' XL All liquid for the destruction of the insect. If a few plants only are affected, they might be put under hand-glasses or into a garden frame and treated there. It is prudent to shade from bright sunshine for a few days those plants which are fumigated.

Dahlias Diseased: D. & Co. Dahlias infested by a Sclerotium, which seems to be almost the same as that attacking Potato haulms—alluded to in the Gardeners' Chronicle in 1880 and again in Vol. XX., 1883—when the discovery of the Peziza (Peziza postuma) upon the sclerotia was announced, and figures given of the stages of development. M. C. C.

DRACENA LINDENT: A. Hatton. Wo are much obliged by your sending the flowering-spike for our inspection.

GARDENER'S MEMORANDUM BOOK: A. C. The exact kind of book that you require would have to be specially made, the manufacturing firms not keeping them in stock. You expect too much from us.

GRAPES: J. Ross. The fruit is affected by the "spot" fungus—Glæosporium leticolor. There is no known cure, but you may reduce the chances of infection by destroying by burning all of the affected bunches.

Grubs on Bulbs of Lilium Auratum: E. Bland. Probably the grubs are the larve of a species of weevil. Let some of them hatch out, and then send the insect here, and we will give you its name. Gather up all that you can and destroy them. Weevils in any stage of development are injurious in the garden.

INSECT: John Johnston. The beetle attacking Lælia anceps is Diaxenes dendrobis, several times alluded to in our columns in connection with Dendrobium. It is an imported insect known at present only in its connection with orchid-houses in this country. R. Med.

INSECTS ON DENDROBIUMS: Puzzled. The insects attacking your Dendrobes are plant-bugs (not beetles) of the genus Lopus. We cannot identify them with any European species, so they were probably imported with the Orchids. R. McL.

** The application to name flowers, and especially fraits, are so unmerous at this season, as severely to two our resources. They entail an expenditure of time, lubour, and money, of which our resources have little idea. We are willing to oblige our enterspondents as far as we can, but we must request that they will observe the rule that not more than six varieties be sent at any one time. The spectures should be pool over, just approaching ripeness, and to prevent disappointment, they should be properly numbered, and everfully packed. We do not undertake to send answers through the post. Delay in any case is unweoldable.

NAMES OF FRUITS: A. S. G. Pears: I, Seckle: 2, Marie Louise d'Uccle; 3, Hambledon Deux ans; Apples, 4, New Hawthornden; 5, Warner's King; 6, King of the Pippins.—C. II., Doncaster. 1, Alexandre Lambre; 2, Bergamotte d'Esperen; 3, Beurré d'Amanlis; 4, Beurré Hardy (all very excellent examples).—E. II. 1, Pear Marie Louise d'Uccle; 3, Duchess of Oldeoburg — not Beauty of Bath; 2, Easter Beurré; 4, Royal Russet; 5, not recognised.—J. H. Pear Doyenné Boussoch, more hand-some than good.—J. M. B. 1, Queen Caroline; 2, Cellini; 3, Striped Beefing; 4, Beachamwell; 7, Downton Nonpareil.—6, Scarlet Noupareil.—7, Downton Nonpareil.—7

Tarr & Arkell. Apple unknown to us.—tiardawr.
1, Chaumontelle; 2, Beurré Clairgeau; 3, not known; 4, Beurré Diel; 5, Bergamotte d'Esperen; 6. Eyewood; 7, Marie Louise.—Dr. King. Pear Louise Bonne of Jersey (over-ripe); Apples, 1 and 2, not recognised, but they are not Lord Suffield; 3, Cox's Pomona; 4, Cellini; 5, Cox's Orange (a fine fruit).—C. Disan Smith. Apple, 1, similar to Beauty of Kent—an old, very excellent Kentish Apple; 2, not knowo.—C. Linsidale. 1, Cox's Orange Pippin; 2, not recognised; 3, Yorkshire Beauty.—D. E. Apples: 1, Lord Derby; 2, not sureof; 3, Brabant Bellefleur; 4, some local sort; 5, Mere 3, Brabaut Belleffeur; 4, some local sort; 5, Mere de Ménage; 6, Golden Noble; Pear, Beurré Clairgeau.—II. N. 1, Beauty of Kent; 2, Lady Henniker; 3, Blenheim Orange; 4, Golden Noble; 5, Stone's Apple; 6, Brantley's Seedling.—Parked in tack-box, in hay, no name sent. 1, 5, King of the Pippins; 7. Ecklinville Seedling; 8, not recognised; 9, Parddisk's Nameroli, 10, Piketen Pippins 9, Braddick's Nonpareil: 10, Ribston Pippin.—
A. Ballard. 1, not recognized (a very fine handsome Apple): 2, Cellini.—J. P. D. Pears: 1, not recognized: 2, Maréchal de la Cour; 3, Beurré Diel; 4, not known; Apples: 5, Besspool; 6, Ladies' Finger. (We had tenpence to pay upon your box.)— F. G. D. 2, Gansell's Bergamotte; 3, Urhaniste; 4, 5, 7, Marie Louise; 6. Chaumontelle.—A. G. B. 1, Cellini; 2, Gloria Mundi; 3, Jolly Beggar; 4, Queen Caroline; 5, Emperor Alexander; 6, Yellow Ingestre.—F. II., Eastnor. Apples: 1, Duchess's Favourite: 2, seems to have been grown under glass, therefore out of the ordinary character; might be Mabbot's Pearmain, or even King of the Pippins.

—F. Lee. Grape: should say it is Alnwick Seedling; rather better flavoured than usual, and well set.—G. Massey. I, Pitmaston Duchess: 2, Beurré Diel.

Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number. — J. C. Tethury. 1, Cratagus Celsiana; 2, C. flava; 3, C. coccinea; 4, Betula (two things here), cannot name without fruit; 5, Cratagus orientalis (C. odoratissima). — S. H. G. Trachelium coculeum.—T. B., Leeds. Gongora galeata, more commonly known in gardens as Acropera Loddigesii and Asplenium Belangieri (syn. Veitchiana).—W. J. W. 1, Cosmos bipinnatus; 2, double purple Larkspur. — J. D., Kangshary. An exceptionally fine form of Cattleya Warscewiczii (syn. C. gigas).—Trappus Fugit.—1, Aster dumosus; 2, specimen not sufficiently good; 3, Aster Amellus; 4, Chrysanthenum uliginosum; 5, llelianthus rigidus.—W. C. Foot. Not a Truffle, but a hard Puff-ball—Scleroderma vulgare. Cattle will not eat it, so there is no danger of its poisoning them. Very common in some places. M. C. C.—G. H. S. 1, Pellionia Daveaneana; 2, Dorstenia contrayerva; 3, Cchmea Weilbachii; 4, Vitis gongyloides; 5, Hedychium fl.wesceus; 6, Brexia madagascariensis; 7, Hibiscus mutabilis.—J. E. 1, Cratagus grandifoha.—E. M. Cannot name it, materials insufficient.

Notice to QUIT Service: A Twenty Years' Reader.

1, Excepting in the case of wilful misconduct, a month's notice is usually given; 2, To be strictly legal, it ought to be given before 12, noon; 3, You can claim a month's wages, and a sum equivalent to the rent of the cottage, fuel, and vegetables, if you have these allowances.

PTERIS: W. G. Some races of garden-raised Pteris are very liable to go in the manner shown by your specimens. Sometimes the brown patches appear after funigation, and sometimes after a sudden fall in the temperature of the house. If you raise the plants yourself, get spores from another place.

Tomato-roots Covered with Warty Excres ences.

A. L. Undoubtelly the work of cel-worms introduced with the soil, which together with the plants, clear out and char; and obtain soil from an uninfected source.

Tulies: Tulip. We should certainly not use them for forcing purposes, nor should we expect first-rate results from them out-of-doors, or in pots.

VINES. R. D. L. We cannot see any Phylloxera mites in the roots sent, but some of them appear to be in an unbealthy condition. Should you find further specimens continuatory of your suspicion, we shall be pleased to examine them.

Walnuts: Harrow. Obtain a long ladder, and some Hazel-rods a dozen or more feet long, and with these appliances you will be able to reach most of the clusters of nuts on the trees. Do not do any more thrashing of the trees than is necessary to dislodge the muts, and do not gather them before the outer husk parts quite freely from the shell of the nut. After drying the muts in the shade, store in slightly moist sand, or place them without sand in large flower-pots covered with another pot or anything that will keep out moisture, and bury in dry ground I foot below the surface. A pinch of salt over each layer of nuts will prevent mould growing on the nuts; indeed, the nuts may be buried in salt if they can be kept in a dry room.

JAMES VEITCH & SONS

ROYAL EXOTIC NURSERY,

CHELSEA, LONDON, S.W.

GRAND NEW CERANIUM.

KING OF DENMARK.

Received an Award of Merit, R. H.S., May 5.

Flowers semi-double, measuring from 2 to 24 inches in diameter; colour rich rosy salmon. Habit of plant dwarf and sturdy. An acquisition either as a pot plant or for cut flowers. Strong plants, in 48-pots, 18, per dozen. Packing free on rail. Cash with order.

M. LARSEN,

Roebuck Nursery, Enfield Highway, Middlesex;

And 273, Covent Garden Flower Market.

Early Winter-Flowering & Forcing Plants.

AZALEA INDICA, fluest kinds for forcing. BEGONIAS, winter-flowering.

BORONIA MEGASTIGMA, fine bushy plants. BOUVARDIAS, crowned with flower-buds, including the latest Novelties.

CARNATIONS, tree varieties, loaded with buds.

CYCLAMEN, our superb Gigauteum strain.

CYTISUS. fine strong plants.

DAPHNE INDICA RUBRA. EPACRIS of sorts, very fine for winter.

ERICA HYEMALIS, GRACILIS, CAFFRA, &c.

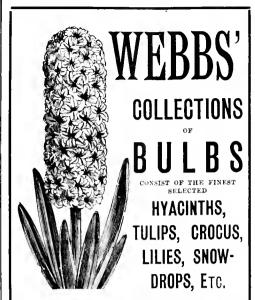

GARDENIAS, best sorts, well budded.

PRIMULA SINENSIS ALBA PLENA, in fine varieties. ROSES, finest Teas and Hybrid Perpetuals, strong plants grown in pots for forcing.

SOLANUM HYBRIDUM, Empress, and other kinds.

GRAPE VINES, Canes very fine this year, & well ripened. Orders are now being executed for the above in fine condition. For Complete List and Prices, see Illustrated Bulb Catalogue, gratis and post-free on application.

VICTORIA & PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

Prices, 5s., 7s. 6d., 10s. 6d., 15s., 21e., 42s., 63s, and 105s. each; Carriage Free.

FIVE PER CENT, DISCOUNT FOR CASH.

Gardeners' Chronicle.

SATURDAY, OCTOBER 10, 1896.

RAMBLES IN NORTH WALES.

BY the end of July the grass was burnt brown-indeed, almost consumed -at Kew, and the leaves were falling fast, so that, after the somewhat monotonous journey by the North-Western Railway, it was highly refreshing to enter the green pastures and copses of North Wales, where wild flowers still abounded, Upper Bangor was our destination, and there, thanks to the kindness of the genial Mr. and Mrs. J. E. Griffith, we found pleasant and comfortable rooms in which to spend so much of our holiday as could not be passed in the open air. Mr. Griffith, I may mention, is the author of the excellent Flora of Anglesca and Carmirconshire, published last year, which is a great help to the lover of the flowers of the field and forest. Indeed, it was owing to this circum-tance that we were so fortunate as to make his acquaintance. When we arrived, the wild Roses were over, but before the end of August there was conspicuous evidence of their abundance and variety in the heavy crop of brilliantly-coloured hips. Brambles, however, were in their full beauty of flower, and Brambles have developed such a variety of forms in this district as to at once attract the attention of the visitor; and Mr. Griffith, aided by the most competent British and continental authorities, has thoroughly worked out this interesting and beautiful element of the native flora. His book and some previous observation had prepared us for the wealth and variety of Blackberries in this neighbourhood, though we can make no pretension to any special knowledge of the characteristics of the numerous forms distinguished by such experts as Mr. Griffith. He has not only a good herbarium of the Blackberries, he has a practical knowledge of their various flavours and qualities, and Blackberry-jam of fine quality is one of the good things we found on his table. Writers in the Gardeners' Chronicle and other papers devoted to gardening are frequently asking why Blackberries are not more generally cultivated. It is, perhaps, because they are no sooner ripe than they begin to decay. Still, I am convinced from early experience that Blackberries may be much improved by cultivation. But that by the way. The one thing that particularly attracted our attention on our first walk from Upper Bangor to Menai Bridge, through Coed Menai, was the profusion, luxuriance, and beauty of one particular kind of Bramble.

On turning to Mr. Griffith's Flora, we found upwards of thirty species or varieties, whichever one is disposed to call them, enumerated as growing in the immediate neighbourhood of

Bangor. The beauty of this particular Bramble, forming the principal part of the undergrowth of the Coed Menai, skirting the road, and half-amile or so in length, made us desireus of knowing its proper name. Of the kinds figured in Syme's English Botany, it is nearest, in the colour and size of its flowers, the one there named discolor, but quite different in foliage. It has an enormous inflorescence, sometimes nearly a vard in length, and pink flowers often nearly 2 inches in diameter. The quality of the fruit we had not a chance of testing, because the children and the birds between them plucked it all before it was quite ripe. As an ornamental plant, however, it is certainly one of the hest among the British Brambles. As Mr. Griffith informed us, it is the form named gymnostachys (syn. R. macrothyrsos) in his book. Our inquiry on this point led to his showing us his collection of dried specimens, concerning which he had a fund of sound information on their several qualities, ornamental and edible. This led up to his offering to accompany us sometimes on our walks-an offer we accepted with much profit and pleasure, for it ended in our collecting, with his assistance, living plants of a few of the most striking kinds for Kew. These included those named R. mercicus var. chrysoxylon, R. gymnostachys, R. cambricus, and R. Griffithianus in Mr. Griffith's Flora. R. cambricus, Mr. Griffith regards as the best of all for fruit. It is, he also informed us, the same as R. lentiginosus. Another fact not, perhaps, very generally known in connection with Brambles, may be worth repeating here. It is not a very uncommon thing for the long, pendent stems to bend down and take root, and continue growing from the same organic apex in an upward direction. In course of time, the connection with the parent plant disappears, and there is an independent plant. Occasionally it happens that the stem or branch rooting in this way is severed from the parent at some distance from the ground, and instead of growing on from the normal apex, the growth is backwards, as it were, from the branch which has become detached. In consequence of this freak in nature, we have a plant with the prickles directed in the opposite direction to the normal one. This, as one can readily imagine, very much puzzled the batologists, or cunning ones in Brambles, until the clue was discovered.

Among the Brambles close down to highwater mark in the Menai Straits, we observed some exceedingly long cable-like stems growing down from the steep declivities towards the water. Some of these were 5 or 6 yards, perhaps more, in length. The Raspberry is very common in the neighbourhood, and the curious Rubus Leesii also occurs. It will be remembered by some readers of the Gardeners' Chronicle that a correspondent some years ago claimed to have raised this particular form as the result of a sexual cross between the Strawborry and Raspberry.

A Bramble, Rubus saxatilis, that one would hardly expect to find at so low a level, is found on the slope of the straits between Menai Bridge and Banger. W. B. H.

(To be continued)

NEW OR NOTEWORTHY PLANTS. ORCHID NOTES AND GLEANINGS.

ERYTHREA ARMATA, Wats.*

The accompanying illustration (fig. 74, p. 425) shows what will most likely prove to be the first instance of Erythrea armata blooming in cultivation, being taken from a specimen growing at Montecito, near Santa Barbara, California, and about sixteen years old, from seed. Last summer it sent out three flower-scapes over 12 feet long, gracefully arching, and of a feathery appearance, bearing myriads of exceedingly minute flowers, which failed to set any fruit. This quite remarkable Palm has become of late not uncommon in gardens, both in California and in Southern Europe, where it goes mostly under the names of Brahea Roczli and B. glauca. In lower California, and here, it is popularly known as "Palma azul" and "Blue Palm," being one of the more glaucous, if not the most, among Palms In its distribution this species is strictly limited to the peninsula of California, making its first appearance some forty miles south of the boundary-line of the United States, and reaching as far down as the neighbourhood of Cape St. Lucas, always in the interior, never approaching the coast. It is essentially a Palm of dry regions, contrary to its only congener, Erythrea edulis, of which a detailed account, by the undersigned, appeared in the Gardeners' Chronicle of April 29, 1893, p. 507; and it is worth mentioning that, in its northern habitat, where it is frequently associated with Washingtonia filifera, E. armata is never found growing in the bed of the canons, which are preferred by the taller and stonter-growing Washingtonias, but is seen only on the cliffs, its rope-like roots finding their way among the parched rocks to a wonderful distance. Under cultivation, E. armata shows a remarkable faculty of adaptation to better conditions, taking willingly to a liberal supply of water, provided the soil be properly drained, and it will then make very fast growth, not to be compared, however, with that of E. edulis, and less than ever with Washingtonia filifera. From the same region of lower California, and adjoining Sonora, other species of fan-Palms have been brought of late years, of which very little is known up to now, and I hope to be able some day to give an account of them to the readers of the Gardeners' Chronicle. The whole of Mexico is sure to be for years to come an inexhaustible mine of vegetable productions, as it is of metallic wealth. Dr. F. Franceschi. [There is a small specimen of this beautiful Palm in the temperate-house at The glaucons blue of the foliage is very Kew. attractive. Ep.]

LELIA PUMILA ALBA VAR. (E. Ashiworth), n. var.

This is a true albino of the plant known in gardens as L. prestans, and of which a variety with white sepals and petals, and with a labellum coloured purple on the anterior part, appeared with Mr. Wm. Bull in 1889, and was named L. præstans alba; and hence the varietal name for the present form in order to distinguish it.

In recording it but little need be said but that it is a snow-white form, with no other colour in any part of it save a chrome-yellow tinge extending from the base to the centre of the lip. In fact, it is a beautiful albino of precisely the same nature as Cattleya intermedia alba (Parthenia). It flowered with D. B. Rappart, Esq., The Promenade, Liscard, Cheshire, at whose request the distinguishing name is given, as the main portion of the plant has passed into the famous collection of Elijah Ashworth, Esq., llarefield Hall, Wilmslow, Cheshire. James O'Brien.

Explired armostic. 8. Watson, in Watson's Bolding of California, ii (1880), 212: "Taller and more graceful than the last (E. edolis), 40 feet high; beaves glaucous, the petioles narrower, more concave above, and margined with numerous stout, more or less hooked, slightly-spreading spines; folds, thirty to forty, split nearly to the middle on both edges, scarely knoerate at the apex, and but slightly filterous, branches of the paniele more slender; carpets densely tomentose; fruit smaller, 9 lines long, the seed half an inch in diameter; embryo at the base Brahea (?) armor'a

BOTANICAL ORCHIDS AT TRING PARK.

In the extensive collection of rare Orchids of botanical interest, formed by the Hon. Walter Rothschild at Triog Park, Tring (gr., Mr. E. Hill), a large number of pretty and interesting things can always be found in flower, but at no season of the year is their beanty so appreciable as at present, when, among the showy species there, the unrivalled Dendrobium Phalænopsis Schroderianum is the only thing in flower in quantity. A group of excellent varieties of these have for a long time adorned the eutrance to one of the large houses, and a handsome picture they make, with that kind of beauty which can be taken in at a glance; but for diversity of form, quaintness of colouring, and marvellous structure, interesting to examine closely, and attempt to divine the meaning of, the species generally known as "botanical" have decided advantages.

Of the many Bulbophyllums now in flower, the gigantic B. grandiflorum, with its extraordinary hooded whitish flowers, exquisitely netted with yellow and brown, and which was illustrated in the Gardeners' Chronicle from Sir Trevor Lawrence's plant, April 6, 1895, p. 429, is one of the most extraordinary species. Among other singular species in flower are Bulbophyllum Dearei, a very showy flower; B. micranthum, Hook. f., with graceful racemes of bright purple flowers; the white B. hirtum and B. auricomum, a very curious Bulbophyllum from Sierra Leone, with stont scape, and head of conspicuous bracts at the top, from which proceed, two or three at a time, some remarkably-formed flowers with black, hairy labellum; two or three forms of that pretty species known in gardens as B. umbellatum, and the allied B. maculosum.

Among the Cirrhopetalums, the noble C. Rothschildianum, by far the handsomest species (illustrated in the Gardeners' Chronicle, Nov. 23, 1895 p. 609), is again sending up its showy flowers; and C. ornatissimum, C. Macrei, C. picturatum, and others are in bloom.

Among the Catasetums, of which there is here a grand collectiou, are in bloom C. Bungerothi, C. macrocarpum, and the hybrid between the two named C. × splendens; several forms of the pretty and variable C. fimbriatum, differing not only in the colonr but in the odour of their flowers—one having the perfume of Anisecd, and another that of the leaves of zonal Pelargoniums. Others in flower are Catasetum purum, C. Imschootianum, C. albo-rosenm, C. callosum, C. Christyanum, and two or three fine species not yet determined.

The cool house has a very complete collection of Masdevallias, Pleurothallis, Restrepias, &c.; and in bloom were noted charming specimens of the singular beetle-like M. gemmata, M. nidifica, and M. gibberosa; the dark purple M. calura, M. Carderi, M. Gaskelliana, M. Reichenbachiana, M. peristeria, M. torta, M. ionocharis; the mossy-stemmed M. muscosa, whose lip closes like a trap on being irritated; M. erythrochæte, M. Davisii, M. x Courtanldiana, M. × Measuresiana and M. × Hincksiana, besides many of the showier but more common species. With these were charming plants of Restrepia antennifera. varying much in the quality of their flowers. One very large form had golden-yellow flowers, spotted with reddish-purple-far superior to the ordinary variety; R. elegans, R. striata, Pleurothallis rhombipetala, P. elachopus, and other Pleurothallis, Octomerias, &c.

In the warmer houses the numerous plants of the scarlet Habenaria militaris, which here grows and propagates with the greatest ease, make a fine show; and H. carnea, H. nivosa, and the large H. Suzanna; also Dendrobium bracteatum and D. b. album, D. antennatum, Hartwegia purpurea, a yellow Spathoglottis, a very interesting lot of Erias and Polystachyas, Koellensteinia graminea, and the handsome Chondrorhyncha Chestertoni, both of which are here almost perpetual bloomers; the handsome Pescatorea Klabochorum, a good representative of a difficult class of Zygopetalums which thrive at Tring Park;

Zygopetalum (Warscewiczella) marginatum, the pretty pure white Odontoglossum Krameri album, several very bright magenta-coloured Cochlioda vulcanica, and a very handsome supposed new Trichocentrum, with large pure white flowers, having a few bloodred spots.

In a cold frame some of the Disas have been blooming well; also Diuris maculata; and still Caladenia alba is in flower.

The long dry summer seems to have suited the Nerines remarkably well, for one of the houses is filled with their brilliant scarlet heads of bloom. towards finishing, and the longest pseudo-bulb is 3 feet 11 inches, with a circumference of bulb of 25 inches. No. 2 has many pseudo-bulbs with six growths, the longest 3 feet 2 inches, with a circumference of bulb of 25 inches, No. 3 has several bulbs, and the longest growth is 2 feet 8 inches, with a circumference of 25 inches. We have seen pseudo-bulbs quite as long, but never so big as three plants, taking them in the aggregate; and moreover, they are short-jointed, the interno les bulking nearly as much as the nodes themselves, and indicating fulness of inflorescence—

as you have been doing! The chances are, when the plants get disturbed by either inserting into larger baskets with more pabulum about them, or if the roots get scraped from the teak-wood, and are carefully dealt with, that the plants might go down; but then to leave well alone won't always do." This is another object-lesson to the best of culturists, that there is no single royal road to success with many of our epiphytai Orchids, J. A.

CATTLEYA DOWIANA AURFA MARMORATA.
But twice before have we seen this lemtifu

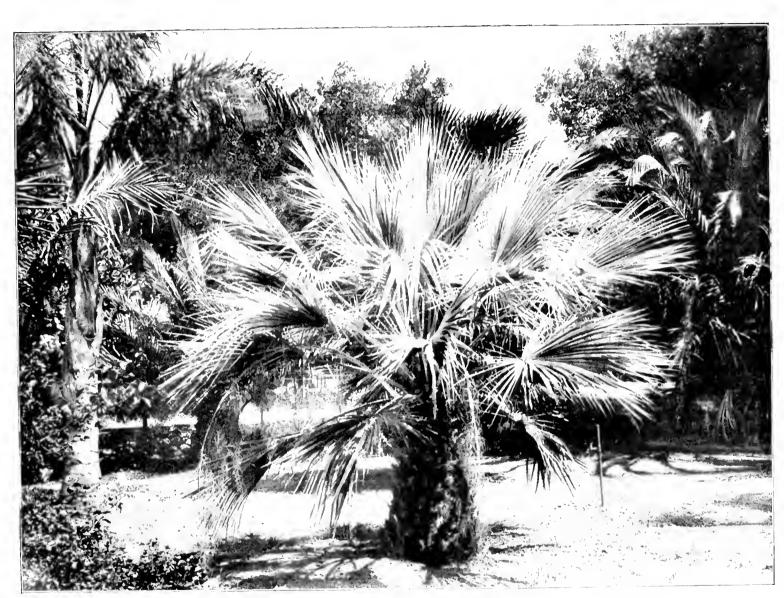

Fig. 74, -- ERYTHREA ARMATA, THE BLUE PALM. (SLE P. 424.)

Dendrobium Wardianum in a Town Greenhouse. In one of those houses which one frequently sees in the back garden of a tenement, constructed to hold a few Orchids without any pretence to being ornamental, are some unique Dendrobium Wardianum. They were purchased three or four years ago by Mr. John Gillibrand, Leanington Street, Blackburn, and placed in square teak baskets of about 9 inches square, and there they have grown, as the owner says himself, "he does not know how," getting a little water just as it suited him, when he came back from the duties of the day, and sometimes not. I place upon record the measurements of three of the plants.—No. I has numerous pseudo-bulbs with four growths getting

quite a sight to look at with their wealth of leaves before the plants wane into a deciduous state. One versed in these things could easily see, as I told the owner himself, that there were "no thanks" to him for what might be called abnormal production. The plants, untouched for three years, suspended from the roof with their pseudo-bulbs hanging down among a nondescript lot of plants, with an earth floor, and that in condition very like the roads outside, according to the weather, and the roots cuveloping the teak-baskets, and looking, like long-planted Orchids, dryish-looking and ripened off. "What am I to do with my plants this time after they have flowered." said Mr. Gillebrand. "That is a poser," answered 1; "do

variety. First from the Right Hon. Lord Roths child's gardens, and then from G. O. Sloper, Esq.; the third specimen is now forwarded by M. Chas. Maron, head gardener to M. Fournier, of Marseilles. It is probably one of the results of the natural crossing of C. Dowiana aurea and C. Warscewiczii, which resulted in C. Hardyana; but in this case the reversion has been markedly towards C. Dowiana aurea. The noble looking flower resembles in most respects a fine form of C. Dowiana, but the sepals and petals are heavily marbled with rose-purple, through which the ground-colour of soft nankeenyellow shows between the veining. It is a handsome variety, and fragrant, like the rest of its class.

THE ROSARY.

THE ROSE SEASON OF 1896.

Two or three weeks back it looked very much as if this subject should be written of in the past tense, but the recent rains put so much new life into the plants that our Roses once more promised a grand autumnal display. The month of June has not the same proverbial monopoly of Rose blossom as was the case years ago; we now have a grand lot of varieties which continue more or less in blos-om all through the summer, and give us a grand display early and late in the season. The old Bourbons, Banksians, Damasks, Gallicas, Provence, and others, seldom bloomed more than once during the season, and that generally at the end of June. The class or section of Hybrid Perpetuals have also been vastly improved in this respect, for if we except a few old favourites such as General Jacqueminot, Alfred Colomb, Charles Lefebyre, Duchesse de Morny, Madame Victor Verdier, Manrice Bernardin, Sénateur Vaisse, and Jules Margottin, there were not many autumnal bloomers of sterling merit in this class forty years ago. The beautiful Teas and Noisettes are grand during every autumn, whether wet or fine, and here we have such a vast choice in the form and substance of blossoms. In a fine and dry autumn, Ernest Metz, Madame Bravy, Comtesse de Panisse, Etoile de Lyon, La Boule d'Or. and others of globular form, will open even better than during the months of June and July, and are a great help to the more single or fewer-petalled varieties that always expand freely.

A notable feature in my Rose-garden is the sudden disappearance of mildew, which had been very prevalent up to the advent of recent showers. I do not remember so sudden recovery from a bad attack before. By the way, it was recently my privilege to see the Waltham Cross Roses, and when in Mr. W. Rumsey's nursery, the most remarkable feature was the absolute freedom from mildew of his new Rose, Mrs. Rumsey. Several hundreds of this grand garden decorative Rose were growing side by side with other varieties, among which I noticed Mrs. John Laing, Queen of Queens, Her Majesty, and Marchioness of Londonderry. These are more than usually subject to mildew, and even Ulrich Brunner was badly attacked, but Mrs. Rumsey was entirely free. I shall have more to say respecting this variety when touching upon the new Roses exhibited this season, but we have none too many varieties so mildew-resisting

Our prospects were particularly good after the mild winter, and I was more than a little surprised to find so much brown pith in the wood when pruning. Several apparently healthy and sound rods, intending for pegging-down, had to be cut away entirely on account of brown unhealthy pith. Nor did the plants in this district break into new growth in nearly so satisfactory a manner as one could wish, owing to the late frosts every morning for some weeks, accompanied by an almost scorehing sun by day. The extreme contrast was evidently a great trial to Roses. Upon walls with a south aspect this was not so noticeable, probably owing to the retention of sunheat by the walls, and its effect upon young Rose growths in this position.

Maggots, and the larvæ of the stem-boring sawfly, were more numerous and destructive than usual, necessitating constant hand-picking during the early part of the summer. Last season I was much troubled with the Rose-weevil, but this season they have been remarkably scarce upon the same ground. The sawfly has been worst upon the Hybrid Sweet Briars, scarcely a single shoot escaping last spring. A few have been attacked throughout the whole summer and long after other Roses were quite free from this pest.

Early-blooming Roses were not good here, and the Reading Show of the National Rose Society was certainly a great surprise to me; the splendid collections of garden Roses, also Teas and II. Perpetuals, being a great treat after those of mid-Sussex at that

date. The intensity of colour throughout the show was remarkable, and if we saw no sensational blossoms, the uniform quality and strong competition was most pleasing. As a matter of fact, the number of blooms staged was 3980, or 320 more than at any other southern provincial show of the National Rose Society, Gloucester running it very closely last year. At the metropolitan show, held in the Crystal Palace, there were only 5064 blossoms staged, or 800 less than the average for a metropolitan show, and this, where there are almost twice the number of classes provided at Reading. The Crystal Palace show was not so good in quality as usual, but was by no means the worst we have seen there, although we heard many persons stoutly maintaining such to be the case. So recently as 1893, the number was much less, while the quality could not be compared to those of the present season. Indeed, I doubt if one could have found a stand equal to Messrs. Harkness' seventy-two, which won the coveted trophy this season, had they chosen from the whole of that class in 1893. There were few, if any, prizes unappropriated; nor did many persons compete unsuccessfully, seeing there were sixtyone prize-winners out of seventy-three exhibitors. Scotland, Ireland, and no less than twenty-one English counties were represented here. The performance of the Messrs, Dicksons & Sons, Newtownards, Ireland, was good. To cut Roses at 7 A.M. the day previous, travel over 500 miles with thirteen changes of train and steamer, and then secure 1st honours in all six classes competed for, deserves some comment.

Mr. O. G. Orpen, Colchester, was one of the most successful amateurs, and secured the Harkness Cup value 25 guineas), not by winning it three times in the aggregate, but consecutively. He also won the Trophy and Gold Medal for eighteen Trees and Noisettes; was 1st for twelve ditto; and well up in several classes. The Northern Exhibition, held at Ulverston, was a decided success, and like the earlier one at Reading, came as a surprise to many, more especially to those who travelled down from London, and were early aware that no Roses had left Colchester, with the exception of a few from Messrs. D. Prior & Son. If we except the Teas and Noisettes, the quality was fully equal to those at the Crystal Palace, and in more than one instance the competition was very keen. Messrs, Harkness & Sons of Bedale, and Mr. Lindsell of Hitchin, have carried off both Trophies offered for nurserymen this season, and the Rev. J. H. Pemberton, Havering-atte-Bower, has done the same in the amateur divisions.

A large number of Silver and Bronze Medals are offered at the various Rose shows of societies affiliated with the National Rose Society, but 1 will only mention the winning blooms at the Society's own exhibitions. At Reading, Mr. O. G. Orpen secured the medal for the best Tea or Noisette, with a rather loose but large flower of Madame Hoste; a good Kaiserin Augusta Victoria (H.T.) also won a medal for Mr. Orpen for the best Rose other than a Tea or Noisette. The best hybrid perpetual in the trade classes at this show was a superbly-finished A. K. Williams, from Messrs. Harkness & Sons, Bedale; and the best Tea or Noisette, a nice bloom of Maman Cochet, from Mr. B. R. Cant, Colchester.

At the Crystal Palace Show the amateur-medal Roses were (Tea-scented) The Bride, from Mr. O. G. Orpen; and (H.P.) Her Majesty, from H. V. Machin, Esq., Worksop. The trade-medal blooms were Mr. B. R. Cant's Duchesse de Morny, and Messrs. Harkness & Sons' Innocente Pirola. At Ulverston, Her Majesty won for Mr. Ward, and Catherine Mermet for Mr. E. B. Lindsell, Hitchin; the trade winners being Messrs. R. Mack & Son, Catterick Bridge, with Victor Hugo, and Mr. Merryweather, Southwell, with Maman Cochet. The last named variety secured two of the medals, Her Majesty also doing the same. Duchesse'de Morny sthe oldest variety of these silvermedal winners, having been brought out thirty-three years ago. Catherine Mermet is also an old variety, the others being introduced between 1877 (A. K. Williams) and 1893 (Maman Cochet). It has not often happened that all of the medal Roses have been good growers and free bloomers, Comtesse de Nadaillae, Horace Vervet, Souvenir d'Elise Vardon, Xavier Olibo, and other magnificent Roses, of but indifferent growth, do not appear once this season. It is also singular that only two of the same varieties won last year, when Her Majesty again secured two m dals, A. K. Williams taking one out of the remaining ten medals. All four of the winners at Gloucester last year were either bad growers, or very indifferent Roses to open.

Once more have the hybrid Teas proved themselves a most useful class and although we earnot say any. thing fresh of such old favourites as La France and Captain Christy, the best introductions in this class during the last decade are among the most valuable Roses grown, Caroline Testout, Viscountess Folke stone, Augustiae Guinoisseau, Kaiseria Augusta Victoria, Marquise Litta, Belle Siebrecht, Clara Watson, Gustave Regis, Madame Abel Chatenay, Madame-Pernet Ducher, and more especially Marjorie, having been most beautiful throughout the season. Marjorie is one of the very best light-coloured Roses grown : it is always clear and clean, of good form, and is produced very freely. The colour is white, suffused with clear salmon-pink, deeper towards the centre — a wonderfully useful Rose, both under glass and in the open.

The most remarkable feature among new Roses was the productions from Messrs. A. Diekson & Sons, Newtownards. This firm have many grand novelties in hand, and it once more secured the Gold Medal for a new seedling or sport with H.P. Helen Keller, a Rose that has come very consistently through the past hot season. Remembering such grand varieties as Mrs. W. J. Grant, Mrs. Sharman Crawford, Marchioness of Loudonderry, Margaret Dickson, Earl of Dufferin, Jeannie Dickson, Ethel Brownlow, and others that have stood the trial of several seasons, we can look forward to the newer introductions with confidence, Mrs. Rumsey was not put up as an exhibition Rose, but it produces a good proportion of blooms, sufficiently fit for that purpose. I never saw a freer bloomer than this Rose, nor any of a more striking colour; always clear and bright, and with from six to twelve good flowers upon a dwarf maiden plant. Each blossom is carried upon long, straight stems, and the mildew-proof foliage renders it one of the very best for decorative purposes, especially towards the end of the summer, when this madaly is most prevalent,

The cold, frosty mornings early in the season checked growth so much, that eyes from the base of dwarfs started sooner than usual, giving us some grand rods early in the summer upon stiff soils and where freely waterel. Those upon La Rosière, General Jacqueminot, Duke of Connaught, Duke of Edinburgh, and others of like habit, flowered well throughout August, when pegged down similar to ripened shoots in the spring, while an ample supply of other rods was made.

A Tea-scented Rose that yearly grows in favour with me is Dr. Grill-one of the first and last to bloom; exceptionally free, in fact always carrying some blooms all through the season. This morning I cut a good bloom with a stem of 18 inches, and upon the same shoot there are still eleven more good blooms that can be cut with equally long stems, and with from five to eight buds around each. It is invaluable for decoration, exquisitely seented, and of a beautifully clear coppery yellow in the centre, melting off to clear rose at the edges. I cannot closo these few rambling notes without mentioning the Hybrid Sweet Briars. The cold weather did not affect these, nor did the dry summer check growth to the same extent as in many other varieties. They have been a valuable addition to the Rose garden from the time their first leaves expanded. One can tell at once when within the neighbourhood of these sweet-foliaged plants. There are three forms in which they surpass other single Roses: as tall standards they droop over, and are a grand sight; they make the finest and stoutest of hedges three seasons after planting, reaching from 12 to 15 feet high, and as far through; they are also grand as specimens upon the lawn, but should never be planted with other Roses, nor grown under glass. A. Piper, Uckfield.

PERESKIA BLEO.

Pereskias differ from all other Cacti in baving a shrubby habit, cylindrical stems, large fleshy Laurellike leaves, and a paniculate inflorescence. They are most nearly allied to Opuntias, which also have true leaves, borne on the young joints of the stems, that fall off at an early stage, except in the case of O.

stems 3 inches in diameter, with green, shining bark, and large cushions of rigid, sharp spines, 2 inches or more in length. The leaves, which are borne thickly on the branches, are ovate-oblong, from 3 inches to 6 inches long; the flowers are 2 inches in diameter, and consist of a regular circle of rosy-red petals, with a cluster of whitish stamens; they remain fresh on the plant several weeks, usually developing in the

The development of the spines of Pereskia is peculiar. In all other Cacti the spines are largest and most abundant on the younger parts of the plant, the older woody parts being either spineless or much less spiny than when they were younger. In Opuntia, for instance, there are few or no spines on the old stems of even such spinesent species as O. horrida and O. nigrescens; and this is the same in Cereus.

FIG. 75.—PERESKIA BLEO: PETALS ROSY-RED, STAMENS WHITE.

subulata, the leaves of which are persistent. But a Pereskia bears no resemblance to an Opuntia, and still less to any other Cactus; it is much more like a Gooseberry-bush, and one of the species, P. aculeata, is known as the West Indian or Barbados Gooseberry. There are about a dozen species, and the largest of them is P. Bleo, of which an illustration (fig. 75) appears, prepared from a large specimen which flowers annually in the Succulent-house at Kew. Here it forms a stout branching shrub about 10 feet high, the stoutest

autumn, but appearing all through the summer on well-grown plants. It is a native of Colombia. P. aculeata also forms a scandent shrub at Kew, and blooms annually, the flowers being in terminal panicles, each 2 inches across, white, tinted with rose, the stamens orange. This species is generally grown as a stock on which to graft Cactus Epiphyllum, but P. Bleo is stonter, and is in every way better for that purpose, the stems of P. aculeata being too slender to earry large heads of Epiphyllum.

Echinocactus &c. In Pereskia the contrary is the case. Thus, in P. aculeata, the younger branches have only short-spines in pairs in the leaf-axils, but very old stems are clothed to the ground with cushions of spines fixed firmly in the bark, each cushion composed of from twenty to fifty spines 1 inch or more in length. From two to six new spines are developed in the centre of each cushion annually, and as the old spines remain firmly attached, the cushions become quite formidable. It would be impossible for an

animal to climb the stem of an old Pereskia. In P. Blee this character is even more striking. The fruit of Pereskia is a fleshy berry, something like a Goose berry, and covered with clusters of short bristles. It is yellow when ripe and edible, being used for making preserves in the West Indies. The leaves of P. Bleo are said to be eaten as salad in Panama. W. W.

PHYSICAL PROPERTIES OF BORDEAUX MIXTURE.

WHEN a moderately diluted milk of lime is mixed with a solution of copper sulphate which is not too dilute, an abundant precipitate is at once formed. Microscopic examination reveals the interesting fact that this precipitate is largely made up of precipitation membranes, often in the form of small cells. The membranes are exceedingly this, and doubtless this is the cause of the precipitate being very bulky and slow in settling. Besides the bluish membranes, there is usually an amorphous granular precipitate, partly adhering to the membranes, and partly free in suspension in the liquid. The precipitation membranes that are closed show very curious phenomena of growth. The membrane breaks at some point, prohably because of pressure from within, and as the solution pours out of the break a new membrane is at once formed, inclosing the liquid a second time. This process is often repeated several times, until finally the cell either collapses or the composition of the liquid it contains becomes the same as that without. The great majority of the membranes seen in the freshly prepared mixture are not closed. This is probably because the calcium hydroxide solution is necessarily very weak. * Frank Schwarz † states that copper acctate solution of 0.5 per cent or less and potassium ferrocyanide of 0.4 per cent, or less give no complete cells. Even where a strong solution (8 per cent) of copper acetate was used, a 0.4 per cent. potassium ferrocyanide solution gave no homogeneous membrane. It is very advantageous that the solution of calcium hydrate cannot be made more concentrated, since it tends to prevent the formation of thick and difficulty permeable membranes, such as often occur where two very strong solutions are mixed.

The writer has found that Bordeaux Mixture prepared from diluted solutions settles more slowly, and the chemical action also seems to be accomplished more quickly. This, it is believed, may be because in a dilute solution fewer closed cells are formed which serve to delay the reaction. It is especially disadvantageous to use lime containing coarse granules, for when ones inclosed in a precipitation membrane the process of solution and precipitation is greatly delayed. The attention of the writer was first drawn to the matter when attempting to prepare Bordeaux Mixture neutral in reaction. Some poorly-slacked granular lime was used, and it was found in a number of eases that after standing twelve to twenty-four hours the mixture became distinctly alkaline, although neutral when prepared.

Some precipitation membranes are impermeable to various solutions. It is not known, however, to what extent the membranes formed in Bordeaux Mixture are permeable to calcium hydroxide or copper sulphate, and the subject offers a promising field for research.

In any attempts to make a mixture similar to Bordeaux, but using potassium or sodium hydroxide instead of lime, the effect of the concentration of the solution on the character of the precipitation membranes would be much greater, since these hydrates are easily obtained in very concentrated solutions.

It is probable that the freshly precipitated copper hydroxide is in the colloid state, and contains much

See table of solubility in future article.

† Schwarz, Frank. Die morphologische und ehemische Zusummensetzung des Protoplasmis; 28 Edlungserschei-Zarennumserzung des Fracepasaris, 25 Franzischen nungen und künstliche Strukture i (Beiträge zur Biologie der Pil azen, herausg v. F. Cohn, 5, H. 1, p. 147).

! The writer would suggest that the difficulty experienced by chemists in washing out the alkali from precipitated by chemists in washing one the amount from providence copper hydroxide may be due to the formation of cells having a thick membrane, and imprisoning the alkali. Possibly the a thick membran; and imprisoning the alkali. Possibly the ditheulty might be avoided by using more dilute solutions in presignt ding

water. This would increase the bulk, reduce the specific gravity of the membranes, and greatly impede settling. To account for the changes undergone by the mixture on standing, it seems necessary to assume that the molecules in the membranes are in a labile arrangement. The extremely bulky nature of the fresh precipitate would also be explained if it could be assumed that it is distended with imbibed water.

The calcium sulphate is apparently never thrown down as precipitation membranes, but always as minute granules or small crystals. The specific gravity of the hydrated sulphate (CaSO,2H,O) is from 2.2 to 2.4.* Because of its low specific gravity, and very fine state of subdivision, it settles slowly.

After standing, very interesting changes take place in the precipitates of the mixture. After a few days, especially if the mixture is agitated occasionally, the precipitates become very much less bulky, and microscopic examinations show that instead of delicate precipitation membranes of Cu(OII), and granules of CaSO, 211, O, the deposit consists of beautiful, regular, and good-sized crystals. In many cases the copper hydroxide is in the form of splendid blue spherocrystals, while the gypsum is usually in twin crystals. It has puzzled the writer to account for the formation of crystals of copper hydroxide, since it is almost absolutely insoluble in the fluid in which it is suspended. However, it is thought that the fresh precipitate in its colloid condition imbibes a considerable quantity of water without dissolving, and may allow the molecules sufficient lability to enable them to rearrange themselves in the form of crystals, † As to the increase in size of the crystals of gypsum, all the writer can suggest is, that as the solution cools after being warmed by the heat liberated in the double composition, it becomes saturated, and still more gypsum erystallises.

When sprayed upon the foliage, the drops of Bordeaux Mixture soon begin to show crystals. A pellicle of calcium carbonate quickly forms, and as evaporation proceeds, calcium sulphate, and probably some calcium hydrate crystallise. As long as wet, and whenever wetted with rain or dew, the neutralisation of the caustic lime proceeds rapidly. This also doubtless takes place slowly when dry, especially if the air contains any moisture. Eventually all the calcium hydrate is changed to calcium earbonate, the length of time required to effect the change varying from a few hours to a few weeks, according to the amount of excess of lime used in making the Bordeaux Mixture and the state of the weather. After this when we'ted with rain, the carbonate is gradually dissolved away, and finally all traces of the mixture disappear.

Adhesive Properties of Bordeaux Mixture.

One of the conditions necessary to the success of a preventive mixture like the Bordeaux is, that it must adhere well, so that neither wind nor rain can easily remove it. . When properly prepared, Bordeaux Mix-

Biedermann, R. Caleium, Ladenburg, Handworterb, d. Chem., 2, p. 442. † Schwarz, Frank. Die morphologische und chemische

Zus anmensetzung des Protoplasmes (Beiträge zur Biologie der Pflauzen, herausg. v. F. Cohn, Heft. 5, 1, pp. 140-154). The changes occurring during the slow growth and on the tanding of procipitation membranes of copper ferrocyanide and other compounds are described and illustrated. In a number of cases a gradual growth of very small granules or crystals within the membrane is described, and some such changes are figured.

! The addition of soap to Bordeaux Mixture to increase the adhesive or wetting expacity was first made in this country by Mr. B. T. Galloway, when trying to find some spray capable of wetting the very waxy young leaves of various sericals (see experiments in the treatment of rost affecting Wheat and other cereals, Jour. of Mycology, vol. vii., No. 3, 180. p. 202. The addition of a considerable amount of song greatly increases the tendency of the liquid to spread. instead of contracting to form large drops. A relatively enormous quantity (.es much or even more than the amount of copper sulphate use I) has to be added to secure this result. The chemical changes involved are almost entirely unknown. It is probable, however, that the whole of the calcium sufthe probable, however, that the whole of the calcium sul-phate must be thrown down as an insolvent lime soap, before the soap can yield a lather with the wa'er. As the calcium sulphate is but slightly soluble, it it possible that even after a lather has formed from the sudden addition of a large amount of sorp, it may continue to dissolve and precipitate the soap in robution, and eventually cause the improved wetting effect due to the sorp to disap, ear. ture has adhesive properties that are truly remarkable, though, according to Girard * several other copper mixtures adhere still better.

Before the evaporation to dryness of the drops of the mixture, a number of factors come into play that have an effect on the sticking qualities of the spray. In the first place, the tendency of the liquid to collect in drops and fall from the leaf may prevent the surface from being evenly wetted, and also prevent any considerable amount from drying on the leaves. As far as can be judged from our present knowledge, the principal copper salt present in Bordeaux Mixture is copper hydroxide Cu(OH)2. As already mentioned, this salt is said to be entirely insoluble in the presence of calcium hydroxide in solution. After the neutralisation of the calcium hydroxide, the rain, containing CO ammonia, and nitrates, can act on the copper and effect the solution of small amounts. In 1887 Millardet and Gayon t published the record of an experiment bearing on the solubility of copper salts in Bordeanx Mixture. This is such an interesting article that we quote from it the following :-

"On April 10 the following types of the mixture were prepared :-

Mixture.		No. 1.	No 2.	No. 3.	No. 4.	No. 5,
Copper sulphate (gr	ammes)	16	15	15	15	15
Pure lime	**	3 36	3 36	6.72	13:44	26 88
Distilled water	(litre)	1	1	1	1	1
		_				

"As may be seen, in No. 1 there is 1 gramme of copper sulphate in excess. No. 2 contains exactly the quantity of lime necessary to precipitate the copper sulphate. Tests made immediately after its preparation showed that there was no excess either of lime or of copper sulphate. No. 3 contains twice as much lime as No. 2, while No. 4 contains twice as much as No. 3. Finally, No. 5, which is the formula in common use, contains twice the quantity in No. 4. These five mixtures were dried at once in a desiccating oven at 36° C.; then the products were pulverised in a mortar. Ten grammes of each of the mixtures were spread in a thin layer between two Berzelius papers, supported below by a fine silk gauze, and were laid thus over five glass dialising jars having equal sized mouths. The necessary precautions were taken to prove whether the paper and the gauze were capable of absorbing any considerable amounts of copper. Extract from "Bulletin No. 9, U.S. Department of Agriculture." (To be continued.)

FORESTRY.

DRAINING WOODLANDS.

Few cultural operations are more beneficial than draining is on wet land, and few the neglect of which do more to prevent a healthy growth taking place in trees. A water-logged soil is fatal to all but swamp-loving plants, and the best soils may be rendered infertile by an excess of moisture. The advantages of draining arable land are not merely confined to the improved mechanical or physical condition of the soil, but also to the increased length of the growing season, by which plants are able to make more use of the materials placed at their command. Practically the same advantages are gained by draining plantations, for although the maturing of the seed of timber-trees may not be such an important matter as in the case of cereals, yet the maturity or ripened condition of the season's woody growth is equally requisite if timber of good quality be desired.

There is a popular belief that when once the trees in a plantation have made a fair start, further attention to the drains is unnocessary, as the roots of the trees have a tendency to dry the soil, and prevent

† Millardet et Gayon. Les divers procédés de traitement du mildion par les composés cuivreux (Jour. d'Agr. prat., 51° ann., T. 1. No. 2, May 19, 1887, pp. 701, 702).

[&]quot; Glrard, Aimé. Recherches sur l'adhérence aux feuilles des plantes, et notamment aux feuilles de la pomme de terre, des composés cuivriques destinés à combattre leurs maladies (Compt. Rend., 114, No. 5, 1892, pp. 234—236)

further stagnation. How far this belief is justified by facts, however, it is difficult to say. That tree-roots absorb large quantities of moisture from the soil goes without saying; but so do the roots of any thick and fast-growing farm crop during the growing season, and we have no reason to believe that the latter have any appreciable influence in drying the soil for any length of time. No doubt the penetration of the soil by the tree-roots renders the surface more porous and permeable by moisture than would otherwise be the case; but this infloence cannot extend to any great depth. Probably the absence of all superficial signs of stagnation account for this more or less widespread belief. When once a humus layer has accumulated on the surface, all, or a great deal, of the stagnant moisture is either absorbed by it, or lies immediately below it, and a comparatively dry footing exists at all but very wet periods. But if a hole be dug, or a tree uprocted by the wind, the true state of affairs is soon seen by the water quickly collecting. In fact, this humus layer rather aggravates the evil by checking evaporation, and giving rise to various organic acids, which are exceedingly injurious to the roots of many trees. The "pumping" of Larch and Scotch Pine stems, due to the infection and decay of the main roots, and which subsequently extends to the bole, is mainly caused by this acidity and lack of acration of the soil, and the havoe caused by gales on flat moory soils may also be traced to the same circumstances. In all such cases, draining is the only sure cure, or preventive measure, although it requires careful consideration whether the crop to be grown will pay for the operation. The distinction between stagnation, and water as passing through the soil, should always be noted. Some species, such as Spruce and Larch, like healthy moisture; others, such as the Alder or Birch, will thrive in a bog, and consequently the amount of draining necessarily varies with the species of tree to be grown. As a general rule, the tree is chosen to suit the situation, and not the situation to suit the tree, therefore the amount of draining required is reduced to a minimum, being chiefly confined to the removal of stagnant water, and the tapping of springs. Any extensive drainage system, such as is common on agricultural land, is certainly out of place in an ordinary plantation, that is, if the expense of cultivation is to hear some relation to the value of the crop cultivated. A great deal depends, of course, upon climate and rainfall. In a warm climate less draining is necessary than in a cold and humid one. In the former, moisture favours the growth of trees; in the latter a wet soil usually causes infertility. It sometimes happens that draining has to be performed after a plantation is some years old, either through neglect at the time of planting, or owing to an impervious layer of soil preventing the desired percolation of moisture beyond a foot or too below the surface. This is sometimes considered a risky business, the sudden removal of the water being likely to lead to bad results. A peat bog, after being drainel, subsides to a considerable extent, and the surfaceroots of any trees growing in it are in pretty much the same position as a man who had been rescued from a watery grave would be if abadoned in a sandy desert. In such a case it is quite conceivable that draining may do a certain amount of harm; but whenever the soil is sufficiently solid and deuse to retain its capillary power and former bulk, little fear need be entertained as to the ultimate result of judicious drainage. A. C. Forbes.

PERCRISTATE FERNS.

In the entire range of foliage plants there is none which for delicate and extreme elaboration of ornamental detail can compare with those forms of Ferns known to the initiated as pereristate—i.e., crested throughout. With the numerous heavily-tasselled forms of the Pteris family most people are familiar-because they are so easily raised, and come so true from spores that nurserymen are enabled to put them on the market by wholesale. Tasselled Maidenhairs are also not unfrequently seen for the same

reason, and if we examine many conservatories and greenhouses where amateurs give Ferns a prominent position, we shall find specimens of various other species-Davallias, Microlepias, some exotic Lastreas, and so on, with the peculiar faculty of cresting or tasselling developed very prettily. In all those, however, this tasselling is confined to the tips of the fronds and the tips of the side divisions, or, at any rate, it is rare to find the tertiary divisions showing any sign. In the true and thorough-bred percristate varieties, however, these tertiary divisions or pinnules are unmistakably and symmetrically "fanned" out or tasselled, so that instead of, as in a merely cristate form, a terminal tassel and a score or so of lateral ones constituting the character, the side divisions are built up of two exquisitely beautiful rows of smaller crests, adding immensely to the charm of the individual frond, and the plant as a whole. Now it is a very extraordinary fact that, despite the immense number of exotic species of Ferns which have been introduced into this country, and the large number of varieties which have originated from these under culture or more rarely as imported wild finds, we are not aware that a single thoroughbred percristate form figures among them; that is to say, such perfect forms as exist among our British varietal Ferns, as we shall presently show. Another remarkable point is, that these extreme forms are not, in most cases, the result of selective culture, but were found in full perfection in a wild state. Among the Shield Ferns, Polystichum angut lare to wit, there is Mr. J. Moly's find, known as eristata gracile, a perfect gem of neatness, of which similar types, but in every case distinct ones, have been found by Dr. Wills, Mr. Gray, Mr. Cowper, and others. In all these the usually sharply-pointed pinnules of the species are delicately "fanned" out into slender numerous teeth at the expense of the tassel at the tip of the frond, which is small. It is, however, amongst the Lady Ferus Athyrium filix formina) that we must naturally seek for Dame Nature's best efforts nor shall we be disappointed. The form known as A. f.-f. Elworthi is perfect in type, being heavily tasselled, perfectly symmetrical, with the pinnules bearing well-developed, fan-shaped tassels. This was found near Nettlecombe. A form found by the late Mr. James in Guernsey, known as A. f. f. corymbiferum Jamesi, has the same character, but the large crests are much heavier and denser. A. f.-f. percristatum consens originated as an accidental seedling at Wanstead, and is therefore not precisely a wild find, though it is not the result of selection. This is the most perfect form we know of, the pinnules being long and slender, with a distinct tassel, and not a fan - shaped expansion as in the previous forms. Its seedlings vary in the extent of the cresting, but are all percristate, and as some of them tend towards A. f.-f. corymbiferum Jamesi, that is a possible origin for it. For the most advanced types of this class in this species we must, however, look to the setigerum or bristly section, the original uncrested plant of which there was found by Mr. Garnett in Lancashire, a beautifully divided variety, in which the usually plain edges of the divisions are densely cut into bristle like projections. The spores of this, strange to say, invariably yield a good percentage of crested forms, muny, or most of which, revert in time to the uncrested state, either wholly or partially. Some, however, have proved constant in themselves, and partially so in their progeny, the ultimate result being a number of peculiarly beautiful forms, with the percristate character so marked that the pinnules are simply bristly tassels of bewildering fineness. Finally, in this connection we have some of the plumose superbum sports of this family, wherein percristation is "going one better," as it were, and the pinnules, or fourth divisions, show the fauning-out distinctly.

It is a well-recognised fact that in all Feins, the divisions and sub-divisions are almost invariably sub-forms of the frond itself, and display the same character, so far as the smaller grade of development permits: hence, as a rule, a robustly grown well-crested Fern will display more

or less evidence of a cresting tendency in its smaller divisions. And we find the same thing to occur with other varietal types, truncate fronds bear truncate pinnie and blunt pinnules and so on; but to be a true percristate Fern as the connoisseur understands it, there must be no half-and-half measures about it, no mere tendency, but a distinct and unmistakable eresting throughout, even in the small plants-and this is so rare a feature, though, as we have seen, it exists in perfection in several of our British species, that no true Fern collector should be without one or more specimens of the best of them. Their delicacy of structure does not mean delicacy of constitution, they are as hardy as the common forms, though ten times as beautiful, and their culture is of the simplest; and yet, just as a prophet has no honour in his own country, these geins of native beauty find no place in countless ferneries where exotics by the thousand rule the reast, and cause far more trouble and expense with lesser returns. Chas. T. Drucry, F.L.S.

BOOK NOTICE.

MANURES: SOIL NITROGEN, AND ITS NITRIFICATION.

THESE subjects, which are so intimately associated with all successful plant-culture, have been very helpfully treated by the able pen of Professor M. P. P. Dehéram in a treatise of 220 pages.*

The author in the first part of his work considers the question of mauures, and states that while farmyard manore remains the foundation of all plantfood supplies, yet the past few seasons of drought have taught some very practical lessons from the fact that owing to the reduced growth of forage crops on the farm, and the consequent reduced production of animal manure, the farmer had necessarily to turn his attention more to artificial manures with which to grow his crops; and also to the introduction in his rotation of those crops which have the power of assimilating from the atmosphere and from the subsoil the nitrogenous plant-food which, if purchased in the market, would be a considerable item of cost.

The author calls attention to the fact that during the past thirty years the discoveries of deposits of natural phosphates and of crude potash salts have caused to be placed upon the market almost unlimited amounts of these materials, and the resources appear to be almost inexhaustible, so that the cultivator will have no lack of an abundant supply of mineral plant-food. While, on the other hand guano from which the uitrogenous plant food has in times past been so largely drawn, is now nearly, if not quite, used up. Nitrate of soda, which was formerly declared to be a mere manurial stimulant, is now generally acknowledged by all practical cultivators to supply nitrogenous plant-food of the most concentrated and direct kind, its action being wholly a feeding one. The deposits of nitrate of soda are immeuse, and distributed over vast areas of country. The late Charles Darwin stated that the greater portion of the southern countries of South America consists of soils containing nitrate of soda. He found that one deposit extended to about 150 miles in length, and from 2 to 3 feet in thickness. The author, however, advises the farmer and the horticulturist to be prepared for the final exhaustion of these beds, immense though they be. An l further, as the manufacture of sulphate of ammonia will from hygienic progress be shortly rendered impossible, we must look forward to a time when we shall be deprived of these two powerful agents of soil fertility. From whence then shall the cultivator of the future derive his supplies of nitrogenous plant-food ' This question is answered in the second part of the work.

Forms of Nitrogen in the Soil.—Nitrogen occurs in the soil under several different conditions, and is derived from varied sources. As a part of the soilair, it exists as free nitrogen where it is essential to the

Paris: Ruett et Cie., Editeurs, 106, Boulevard Saint-Germain.

life of certain microscopic forms which seize upon it and render it available to higher plants. Temporarily and in transition stages, nitrogen occurs in the soil as ammenia and as nitrous acid, but these forms pass rapidly into nitric acid from which most of the higher plants derive their chief supply. By far the larger part of the nitrogen of soils is, however, stored in the form of humus, and this through the processes of fermentation and of nitrification is gradually made available to plants in the form of nitric acid. The roots of growing crops and of vegetable products incorporated with the mould contributes no small amount of material to the stores of organic matters in the soil, a part of which is converted into humus, but the plants whose roots leave in the soil the largest amounts of nitrogen are these belonging to the Leguminous family, such as Clovers, Beans. Peas, Lupins, &c.

Sources of Soil Nitrogen.—The author says, in asking from whence comes the nitrogen of the soil? we raise one of the most important questions of practical culture, and one which to day is taxing to the utmost the skill of many very able investigators.

In the greater number of ordinary soils the proportion of both carbon and nitrogen become less and less as we penetrate below the surface, consequently these substances must have had their origin in vegetation which had once grown upon the surface. Some soils which are called alluvial possess a subsoil-fertility which appears to have been a deposit derived from the remains of vegetation washed from other soils. Fertility of soils is, therefore, due to the organic residue of previous generations of plants, mixed with certain mineral substances, the most important of which are the phosphates and potash.

The soil, then, is the medium in which the conversion of any form of nitrogenous compounds, whether animal or vegetable, into ammonia and nitric acid is effected: this is partly absorbed by the plants, partly fixed by the soil, and partly also, if opportunity offers, carried away by running water. The action of the soil, however, does not stop there! multitudes of living and active organisms, constantly present in it, transform with great rapidity the ammonia into nitrate, in which form cultivated plants greedily absorb and convert it to their uses.

Green Manuring .- Ti e author deals largely with tho principles of green-manuring, since this practice bears in an important manner upon the nitrogen question. and offers an explanation of some of the statements made in the text. To incorporate great masses of vegetable matter into a soil increases its waterholding power, makes it more porous and richer in humus, and imparts to it certain physical properties which are highly beneficial to plant life and the growth of crops. But we distinguish between two classes of plants: the nitrogen consumers, and the nitregen producers; the latter possessing the important property of being able to live upon the nitrogen of the air; they produce not nitrogen, nor something that did not exist before, but they convert the non-serviceable free nitrogen of the air into serviceable combined nitrogen of plant and soil. All nitrogen-producers, so far discovered, are leguminous plants, and it is probable that every member of this family possesses this power. Peas, Beans, Vetches Clover, Serradella, and Lupins have in turn been the objects of experiments, and, while much yet remains to be explained, it is now known that we have in nature great numbers of minute microscopic organisms living in the soil, which have the habit of locating themselves upon the roots of certain kinds of plants, and especially those of the leguminous family. These organisms, once seated upon the roots of a plant congenial to them, cause the formation of little enlargements or tubercles, in which they live, drawing nourishment from the plant upon which they have established their home, but in return giving to it compounds of nitrogen which these organisms are able to produce from the free nitrogen of the soil-air.

This living together of the leguminous plant and the adventitious organism for mutual benefit is frequently met with in the vegetable kingdom, and is called symbiosis; it is a purely ousiness relation, and when either host or visitor overtakes and crowds out the other, the death of both results speedily.

We must refer the reader to the work itself for a more complete resums of this important subject, and one that seems likely in the near future to cause a revolution in the practices of the agricultural world, and to a certain extent those of the horticulturist also. J. J. Willis, Harpenden.

THE WEEK'S WORK.

THE FLOWER GARDEN.

By Hedley Warren, Gardener, Aston Clinton, Tring.

Shrubberieson Grassy Banks.—Those banks which are steep, and therefore difficult to mow with a machine, might be made more ornamental in feature, if instead of being turfed, they were planted with evergreen shrubs and plants suitable to form undergrowth, and if here and there a mass of reck-work or tree-roets were placed, on which scandent and trailing plants might spread at will. Such an arrangement might include plants of a more or less upright habit of growth, which should be planted at a variety of distances apart. Those best suited for this purpose are Berberis stenophylla, variegated Box, Escallonia macrantha, where not too tender: Cupressus in variety; Juniperus chinensis, Thuia in variety, Hollies, Gynerium argenteum, Mahonia Herveyi, Golden Privet, the varieties of the Yew with yellow variegated foliage; Yuccas gloriosa and filamentosa. Plants suitable for forming undergrowth may include the following: Cotoneaster microphylla and Simonsii, St. John's Wort, Periwinkles, Ivies in variety, and Mahonia aquifolia. Ericas, Honeysuckles, &c. Such an arrangement would have the advantage of taking less labour in the keeping than grass, besides being a pleasing feature.

Climbing Plants for Walls.—These familiar subjects will soon demand attention if new species are going to be planted, or the old plants re-arranged. All new stations should be well manured, and the soil trenched two or three spades deep, as any special pains taken in this respect will aid the plants in get-ting a good start, and enable them to make rapid growth, and remain in vigour for a number of years. Among plants which cling without assistance, except at the first, are all the species and varieties of Ivy, and Veitch's var. of Ampelopsis (A. tricuspidata the common species does not climb) are the best. Bignonia radicans is another plant that requires but assistance, excepting when first planted. Wistaria sinensis and the Magnolias are all good plants for covering large spaces. Cratagus pyracantha, C. p. Lelandi, Cotoneaster Simonsii, and C. microphylla are plants whose bright red berries make them desirable plants in the winter season, and should find a in every collection, the first two especially. Escallonia macrantha, pretty in foliage and bloom, requires a somewhat sheltered position, or to be protected during hard weather. Ceanothus azurcus and others, Honeysuckles, Passiflora cerulea, Roses, Clematis, and many others may also be used with good effect.

Michaelmas Daisies are new at their best, and a few remarks on the best varieties will be of use to many. One of the earliest Asters is linarizefolius, which is a very pretty variety, that continues to flower freely well into October; the habit is dwarf and compact, and the flowers are of a very pretty blue colour. A. Amellus and A. bessarabicus are amongst the most beautiful, and should be include l in every collection. A. niveus is a good white variety, and very useful for cutting. A. Chapmani has beautiful large blue flowers, which, when arranged in glasses with autumn coloured foliages, always look nice. A. ericoides has small-sized pretty flowers, white with a yellow centre: and the plant is about 3 feet in height. A. longifolius fermosus is a dwarf compact-growing variety about 2 feet in height, producing flowers of a pleasing rosy hne. A. sibiricus is a very distinct-looking plant, growing as a rule not higher than 1 foot, the colour bright lavender; but it varies slightly in different soils. Of late-blooming varieties, there are Asters grandiflorus, lavis, Shorti, and paniculatus. For Asters the easiest mode of propagation is by division of the roots, which may be done as soon as the plants have ceased flowering, or early in the spring, just as they are beginning to move, and in cold soils the latter method is the better one; but in sandy, open soils, autuum division is more suitable. When planting or re-planting Asters, plenty of well rotted manure should be dug into the soil,

and the latter worked to a good depth, for the plants, being gross feeders, they seen exhaust it. In places where a large supply of flower is wanted at this season, Asters should be largely grown.

THE HARDY FRUIT GARDEN.

By G. WOODGATE, Gardener, Rolleston Hall, Burton-on-Trent.

The season for planting most kinds of fruit trees having arrived, all necessary arrangements should be made so that no undue delay may occur when the work is commenced. These preparations may consist of notes of the various varieties, which give the longest supply of the different kinds of fruit; those which are found to do the best in the district; the number of each variety required for making good vacancies, or for forming new quarters of fruit-trees and bushes. Orders for these should be sent to the nurseryman early, in order that the trees, &c., may be received and planted in good time, and while there is some little warmth in the soil to encourage rooting. Trees which are planted just before or as soon as the leaves have fatlen make earlier and better growth in the spring, and require much less after-attention than spring-planted ones. Land intended for carrying fruit trees for a great number of years requires good culti-vation; it should be deeply trenched, if it will bear it, but in most cases it is better practice to keep the true top-spit still at the top, and trenching and well breaking up the soil beneath it. In process of digging, use plenty of lime-rubble and charred seil and rubbish, if the subsoil is retentive; and unless the soil is poor in plant-nutriment it is better not to add any manure before the planting is done, and then merely as a top-dressing and mulch.

Fresh loamy soil should be got in readiness in sufficient quantity to afford a good barrew-load to each tree or bush. A good sort of planting-compost is six parts goed turfy loam, four parts old petting-seil, and one part wood-ashes, with a sprinkling of fresh slaked lime, all well mixed together, and placed under cover till wanted. Most kitchen gardens are well drained, but when fresh land is to be planted, the drainage of the same is a matter of the first importance. In fruit-bearing land the distance between the drains will depend upon its nature, but the depth at which the pipes are laid should not be less than 3 feet, and not more than I feet.

Blackberries.—As soon as the fruit is gathered from the plants, the netting, or other protection which may have been used, should be taken off them and thoroughly dried and stored in a dry place, and well out of the reach of mice. Cut away all the old fruiting-wood of the brambles, and tie up a sufficient number of the strongest to take the place of the old ones removed. All weak and superfluous growths should likewiso be cut out, and the stools afforded one or two good applications of fairly strong manure-water.

THE ORCHID HOUSES.

By W. H. WHITE, Burford, Dorking.

Hints in Regard to Temperature. -At this season cultivators of Orchids will have to prepare for sudden alternations in the outside temperature, and especially in the early morning hours, when sharp frosts often occur without any warning. The proper method to avert injury to the plants from this cause, is to keep a rather higher temperature whenever a frost is likely to occur. During October the degrees of warmth at night should be—East India-house, 65° to 70°; Cattleya and Mexican-houses, 60° to 65°; intermediate-house, 55° to 60° , the higher degrees being employed when the external air is at about 45° or 50, but when the thermometer outside nears the freezing-point, the lewer figures are preferable. In either case, when banking-up the fires the last thing at night, the gardener should so manipulate the dampers that there may he a fall of several degrees by the early morning hours. If the temperature of the various houses should fall below what is censidered right, no water must be afforded to any of the plants, or any damping down proceeded with, before the temperature has risen to the proper height, as under the circumstances the drier the air of the house the less risk there is of plants getting chilled. The Odontoglossum-house should be kept at about 55; or in the event of cold weather, at about 50°. Be sure that no plant is very near to the roof-glass, particularly plants of Phalænopsis, Epidendrum bicornutum, Augræeums, Grammangis Ellisii, Brough-tonia sanguinea, the tall-growing Cattleyas and Lielias, and ospecially L. elegans, all of which are irreparably injured if they get in the least degree chilled. The deciduous Calanthes would be safer if they are now lewered 1 foot or further from

the glass, the leaves often becoming spotted and prematurely decayed from this cause. As the pseudo-bulbs of such species of Calanthes are now full grown, and the bloom-spikes pushing up, the regular application of liquid-manure ought to cease. The tips of the leaves are also commencing to turn brown, and although these are unsightly they must not be clipped off, but allowed to remain till decayed naturally, and as the foliage decays so should the amount of water afforded gradually decrease, and by the time several blooms have appeared withheld altogether.

The Intermediate-house.—In this house the plants of Vanda Kimballiana and V. Amesiana are pushing up their flower-spikes, and seeing that both species require but little water in order to keep them plump, very little should be afforded—in fact, the latter should be kept on the dry side, its thick sreculent foliage being liable to decay if much moisture be afforded. Strong plants of Cymbidium Lowianum, and C. Lowio ebunneum, on the contrary, now showing their flower-spikes, should be afforded plenty of moisture at the root, and those not yet showing for flower kept rather dry at the root for several weeks longer, otherwise there will be a re-commencement of growth, and a consequent failure of the plant to flower. In the coolest part of this house Cypripedium Spicerianum, C. Charlesworthi, and C. Schlimi usually thrive luxuriantly, and in most cases their flowers will be about to expand. These last a long time in good condition. These three species should be grown by everyone who is an admirer of Cypripediums, their cultivation presenting no diffi ulties when carried out in a comparatively cool house with abundance of rootmoisture afforded at all times. Cypripedium insigne and its varieties are also showing for bloom, and the spikes should be guided up through the strong leaves. Plants of Coclogyne cristata and its varieties should be encouraged to finish up strengly, for the larger the pseudo-bulbs, the greater the number of the Lowers. Abundance of water should now be afforded Lowers. Abundance of water should now be afforded them till the flower-spikes appear, and then gradually reduced. The different varieties of Miltonia spectabilis, M. Moreliana, M. Bluntii, and M. Lubbersiana, make a very pleasing show at this season. After the flowers of these Miltonias fade, a short season of rest in the coolest part of the house should be afforded the plants, very little water being applied before growth recommences.

PLANTS UNDER GLASS.

By Jno. MeIntyre, Gurdener Woodside, Darlington.

Primula sinensis.—The earliest batch of plants soon coming into bloom should receive a shift into pots sufficiently large for them, small though they be; three and four pegs 1\frac{1}{2} inch long, either before potting or directly it is done, should be placed round the short stems of the plants to steady them, as if this be not done, the plants in handling are apt to break eff at the collar. It is a good practice, when the final re-potting is performed, to surround the stem just at its junction with the soil with small bits of charcoal, which serve to absorb moisture at a point at which the plants are liable to damp-off even when most carefully afforded water. The succession plants, if large specimens are required, should also receive a final re-potting. 7 or 8 inch pots being the sizes chosen; which, excepting for exhibition plants, are sufficiently large. Primula sinensis, when finally re-potted into 5 and 6 inch pots, are more useful for ordinary purposes than when the pots and plants are larger. After this date all the stock of plants of Primula sinensis should be housed in a greenhouse or Peach-house, placing them near the glass. It is of great importance that the plants are placed where they are free from drip and damp, and there is good ventilation.

The Houses,—In October all glasshouse-roofs should be thoroughly washed outside, in order to remove all mather that will obstruct the light. Some gardeners never wash the outside of the roof, depending on the rain to do this, but it is certain that at the end of autamn there is sure to be a great amount of accumulated dirt upon it, which renders the glass to a certain extent impervious to light. At Woodside this job is regarded as a most important one.

Small Elying Plants for the Plant-stages.—There is still time to propagate those dwarf or creeping plants used for edgings of all sorts, namely, Selaginella denticulata, S. Mertensii, S. M. variegata, S. apoda, &c. Oplismenus Burmanni, Tradescantias, Ficus repens, &c. These small plants, if fresh looking and healthy, are of much use for indoors decoration of all kinds.

and one can scarcely have too many of them, hence the need to be always raising fresh stock.

Winter-flowering Species of Begonias may be classed with winter-flowering stove-plants, requiring, as do those, a little extra attention at this season. These species of Begonia, when well done, afford quantities of cheerful-looking flowers, useful for cutting, often fragrant; and the plants, it planted out against the walls of the stove or warm conservatory, afford bloom abundantly.

Gardenias should be afforded a warmth of 70° by night, and 75° or a little more by day, which will cause the plants to grow freely and set their flower-buds. To keep them free from aphis and mealy-bug, dip them overhead in scapsuds made with soft-scap, and having a warmth of 90°; to kill mealy-bug, adding petroleum at the rate of one wine-glassful to one gallou of scapsuds.

FRUITS UNDER GLASS.

By W. Poer, Gardener, Highelere Catle, Newbury.

Earliest Pot Fig Trees, -As soon as the leaves fall, the required amount of pruning of the shoots should be performed, and the trees washed with warm soapsuds; and if scale or red spider have been noticed on the trees during the season, let them be dressed with a solution of soft-soap at the rate of 4 oz. to 1 gallon of hot-water, and half a wine-glassful of petroleum, all being well mixed together. Apply this with a soft brush to every part of the tree, being careful, however, not to damage the embryo fruits. If repotting be necessary, there should be ne delay in doing it. The plints being turned out of the pots or tube should have some of the soil taken from the sides of the ball, the roots shortened, and then be reported into slightly larger pots or tubs. If, as is the case in process of time, the largest size of pot desirable has been reached, of time, the largest size of pot desirable has been reached, the annual reporting may be varied by picking up the surface soil, going as far down as it can be conveniently got at, shortening the roots thus laid bare, and filling with fresh soil rammed firmly together. It is, however, advisable, say, every third year, to turn out the trees, reducing the roots slightly in length, and more especially those at the bottom, and reporting in the same pots or others of the same size. Let the drainage be thoroughly overhanded, it being very important that the water passes freely away. The soil portant that the water passes freely away. The soil employed in potting Figs should consist of four parts good yellow loam, one part mortar rubbish, a small portion of well-decayed sich manure, and a sprinkling of crushed bones.

The Earliest Peach house.—The trees being at rest, the house should be kept cool and airy at all times; and if the top lights are removable, they should be taken off, and the house kept in this state till the time arrives for closing it. The recent heavy rainfall will obviate the need of watering any of the borders that are fully exposed for some time to come, but where the reof lights are not removable, care must be taken that the borders do not lack moisture at this season, affording also liquid-manure to old, healthy trees which are becoming weak from age, or from being heavily cropped, and even the fully exposed wall trees will be benefited by manure-water, provided the drainage is good. The liquid-manure, when applied whilst the trees are at rest, will not need diluting with clear water. If the pruning of the trees has not been done, no time should now be lost; dressing them afterwards with an insecticide, securing the branches and shoots to the trellis, and putting the house in proper order for foreing.

Second Early and Mid-season Peach-houses,—Trees requiring to be lifted should be seen to before the leaves fall, especially young trees inclined to make gross growth. Once fruitfulness is attained, excess of growth is generally arrested for some years. The operations of tree-lifting should be rapidly performed, so as not to expose the roots longer than necessary. Mutilated roots should be cut away eleanly with a sharp knife, also such of them as may have gone deep into the soil, bringing the latter nearer the surface, and laying them in fresh soil. During the work of replanting, make the ground thoroughly firm, affording a good watering, and a mulching of short manure.

THE KITCHEN GARDEN.

By CHARLES HERRIN, Gurdener, Dropmore, Maidenhead.

Late Potatos.—The first opportunity should now be taken of dry weather to lift the tubers of Potatos still remaining in the ground, nothing being gained by their

being left any longer in the soil. If the tops are vigorous, cut them off, and place in a heap with some combustible materials and burn them forthwith, and proceed with all expedition to lift the crop. dug out, the tubers should remain on the surface an hour or two to dry, most of the soil adhering to the tubers then falling off, and they can be stored in a clean condition. It will simplify the storing if the tubers that are suitable for consumption be gathered up first, leaving the small ones and those fit for planting purposes to be gathered up afterwards. Where a cool, roomy root-store exists, which is constructed partly underground, this is the best place for storing Potatos, as here they can be turned over and examined by the men in bad weather as occaexamined by the men in bad weather as occasion may require, and diseased or decaying tubers removed. Potatos from a store of this description taste better than do those taken direct from a pit or clamp. The latter must, however, in many gardens be used in lieu of better accommodation. The clamp should be located in some shady, dry spot; and in making it, a commencement should be made by throwing out the earth to the depth of 1 foot, and width of 3 feer, the length being determined by the quantity of tubers to be stored in it. The bottom and sides should be lined with dry bracken, straw, or similar material, and the Potatos piled up into a ridge, and covered with about 6 inches of bracken, &c., before the soil is banked over them; and as there is always a certain amount of sweating in such a mass of dampish tubers, the final closing of the ridge with soil should be delayed for a few days, to allow some at least of the moisture to escape, and taking the precaution to cover with tarpaulin, &c., at night or when it is likely to rain. In storing the tubers, the first Potatos required should be placed at one end of the ridge, and the remainder in rotation, divisions for the varieties being easily made across the clamp with bracken or clean straw. The sets for planting thould be placed in some cool yet frost-proof shed, those of Ashleafs and other varieties being spread out thinly upon shelves, or stood endways up in boxes

Rectroot.—As frosts are likely soon to occur, the crop should be stored on a fine dry day. It is good practice to loosen the soil between the rows with a dizging-fork, as there is then but little chance of their losing the tip on being drawn out of the soil. Throw asde all coarse and over-large roots; and twist the tops off the best samples. Select also some of the finest shape and colour for seeding purposes, and store apart from the bulk of the crop. Clamping is the more satisfactory method of storing Rectroots, as is proved by the fact that we have still some of last year's crop in good usable condition. Our clamp is in a shady spot.

Brusse's Sprouts.—The plants have made luxuriant growth during the past month, and although ours were planted later than usual, good Sprouts ready for use are plentiful on the stems. As Brussels Sprouts are essentially a winter vegetable, it is not prudent to begin to send them into the kitchen at too early a date, certainly not till Scarlet Runner and other Beans are over. As there are always a number of decaying leaves on the stems of the earlier successions of the plants, these should be removed and cleared away on a dry day, the freeing of the stems from these allowing the air to circulate freely amongst the plants, enabling them the better to withstand hard frosts.

Variorum.

TELEPHONE AND OTHER WIRES, AND STORMS.

-- It has long been held from practical experience that the network of wires now found in many towns protects those places from the effects of lightning, and probably also prevents many thunderstorms from breaking over them. An official in juiry has been recently made in Germany as to the influence exerted by telephone wires on atmospheric electricity, with a view to set at rest the question whether danger from lightning stroke is increased or diminished by a close network of wires. According to the Dis Wetter, the inquiry has shown that the wires tend to weaken the violence and diminish the danger of the lightningstroke. Returns obtained from 340 towns provided, and from 560 not provided, with a telephone system, show that the danger varies in the proportion of 1 to 4.6 between the two cases.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Illustrations. - The Editor will thankfully receive and select photographs or drowings, suitable for reproduction in these of gardens, or of remarkable plants, flowers, trees. de.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

SUNDAY, Oct 11-Brussels Orchideenne Meet, Royal Horticultural Society's Committees at Drill Hall, West-imuster. TUESDAY. SALES.

Unteh Bulbs, at Protheroe & Morris' Rooms. Bulbs and Liliums, Shrubs and Plants, at Stevens' Rooms. MONDAY. Dutch Bulbs, at Protheroe & Morris Reams,
Great Sale of Roses, Fruit Trees, and other Sock, at Arches Farm, Framfield, by order of Messrs. Win Paul & Son, by Protheroe & Morris.
Bulbs and Plants, at Stevens Rooms. TUESDAY, Oct. 13

Dutch Bulbs, at Protheroe & Morris' Rooms. Morris' Rooms, First Special List and Plant Sale, at Protheroc & Morris' Rooms, Bulbs, Palms, Liliums, Roses, Shrubs, &c., at Stevens' Rooms. WEDNESDAY, Oct. 14

Dutch Bulbs, at Protheroe & Morris' Rooms.
Unreserved Sale of Hollies, Forest Trees, and other Nursery Stock, at the Houghton Park Gardens, Ampthill, Beds, by order of Mr J. Crick, by Protheroe & Morris, Bulbs, and Plants, at Stevens' Rooms. THURSDAY, Oct. 15

Or 16

| Dutch Bulbs, at Protheroe & Morris' Rooms.
| Established and Imported Orchi'ls, at Protheroe & Morris' Rooms.
| Scientific and Miscellaneous Property, at Stevens' Rooms. FRIDAY.

Oct. 17 (Dutch and French Bulbs, at Ste-vens' Rooms SATURDAY.

CORRECTED AVERAGE TEMPERATURE FOR THE EN-SUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY THREE YEARS, AT CHISWICK .- 51'3'.

DISCUSSIONS in and out of Parliament during the session of Fraduce 1896, respecting agricultural and market gardening disabilities, have had the effect of forcing into prominence the urgent necessity for cheapening and expediting the carriage of produce to markets in towns and cities all over the country. It is a fact that foreign produce can often be more swiftly and economically brought to the salesman than can that of the home producer. A ship-canal strikes right into the heart of the land, and by this means may be deposited in a great centre of pepulation provisions from the uttermost ends of the earth, which find quick sale, and are despatched and received at the furthest limits of the United Kingdom within a few hours of being handed over the ship's-side. The marketgardener at home can best say under what conditions of time and expense his goods are marketed, and how his accounts are balanced year by year. It pays in the fruit season to have special steamers from French ports and from those of Belgium and Holland to catch the English market; and the same applies to vegetable produce. Meanwhile, apart from railway carriage, the great highways leading, say, to London, from all parts of the compass re-echo, night after night, the weary tread of the great and filthy market - waggons, making their way through many miles of tedious haulage, returning with the empties and manure after some hours of unrest in the vicinity of the various market-places.

Light railways may now be constructed with

certain relaxation of the rules applicable to road locomotives, and some encouragement is given to new-fangled motors for hauling on country roads, and to the extension of tramway schemes for lightening burdens affecting the utilisation of the soil. Why not focus the whole under the kindly care of one great combination; comprising representatives of London-of the County Council, the Corporation, the Chambers of Commerce, the Institutes of Civil and Mechanical Engineers, and other bodies? No. benefit, as a rule, accrues from isolated efforts -though in the matter of agitation isolated effort may be of great advantage. One such case has just been placed on record. An impertant proposal-novel so far as affecting the north of England, and emanating from the Board of Directors of the Manchester Chamber of Commerce, was made public in Manchester on July 23. The Chamber after having evidence of the practice in other countries respecting the use of tramways for the carriage of merchandise by night passed a resolution to the effect that, "in their opinion, the utilisation of the existing tramway lines would be a very great advantage to the trade and industries of Manchester and neighbourhood-more especially in connection with the traffic to aud from the Ship Canal Docks; and that the present time is opportune for calling public attention to this important question.

It would be for the great combination above alluded to-meeting during the Parliamentary recess-to take stock of such Acts of Parliament as bear on the problem to be solved, and with the help of the Home Office and the officials of the Department of Agriculture, formulate a programme of procedure as affecting two or three large centres of population. Unfortunately, London is divided, as it were, against itself, but that would not prevent the drawing-up of a scheme for the rapid transmission to all the metropolitan markets of the produce grown within a radius of, say, ten miles, by the aid of new methods, old water-ways, and the use by night of the many lines of tramway now in existence, supplemented by miles of light railway. Rents and rates are so heavy-so burdensome to the grower who has to compete with foreign growers not so handicapped as he -that we venture to believe a large meed of success would follow the efforts of the combination of authorities to which attention has been drawn above.

Since the above has been in type, a commercial contemporary has mentioned that the snecess of Mr. Balfour's light railways in Ireland is assured. One or two companies are being formed to work some mineral properties lying close to the lines-one for plumbago, which was proved of value some years since. Of course, other goods than agricultural produce would be carried on the lines to be constructed on this side of the Irish Channel. Several of our great railway companies are now prepared to carry small parcels of marketgarden and kindred produce, by passenger trains, at a more moderate price than formerly. The motives of the companies may be purely patriotic-perhaps not; at any rate, it is to be hoped that this move may not interfere with the formation of companies for the laying down of light railways, wherever a profitable opening may be found for such.*

ROYAL HORTICULTURAL SOCIETY .-- The next Fruit and Floral Meeting of the Royal Horticultural Society will be held on Tuesday, October 13, in the Drill Hall, James Street, Vietoria Street, Westminster, I to 5 P.M. At 3 o'clock, a Lecture will be given by Mr. E. BURRELL on "Hardy Summer Flowers." The Committees will meet as usual.

CHRYSANTHEMUMS IN THE LONDON PARKS .-The exhibition of Chrysanthemums in Southwark Park, as we are informed by the superintendent, will he opened to the public on Thursday, the 15th inst. There are here between 3,000 and 4,000 plants, including a number of novelties. The plants are looking well, and there is a prospect of a display as good as that of last year.

DINNER-TABLE DECORATIONS AT OXFORD .-The decoration of the Imperial luncheon-table at Oxford station on Tuesday, October 4, was most elaborate, the principal flowers used being Orchids, amongst which were beautiful and large spikes of Odontoglossum Alexandræ, O. grando Oneidium maeranthum, and fine examples of rare Cypripediums, and other beautiful Orchids. The centre of the table was occupied by a golden basket filled with these flowers, intermixed with fronds of Adiantum Farleyense, leaves of Croton and other exoties, the basket being still further decorated with ribbons of the Russian and English colours. Other smaller gold baskets were filled with Orchids, Pitcher-plants, &c., and an elaborate design arranged upon the cloth completed the decorations. The basket of Orchids from the centre of the luncheon table was graciously accepted by the Tsaritza. The floral decorations were carried out by Messrs. WILLS & SEGAR, florists, of London,

RANDIA MACULATA.—In addition to the particulars afforded in our note on this plant in our last issue, Mr. HARROW, of the Royal Botanic Gardens, Edinburgh, said that the plant when received from Kew in 1893 was about 2 feet high, and stood in an 8 inch pot. Under pot-culture a floriferous habit does not seem to be fully attained, and the growth is slow. Pruning is not followed by good results, and no new growth has formed on the parts upon the shoots which were praned. When in full flower the plant is very attractive.

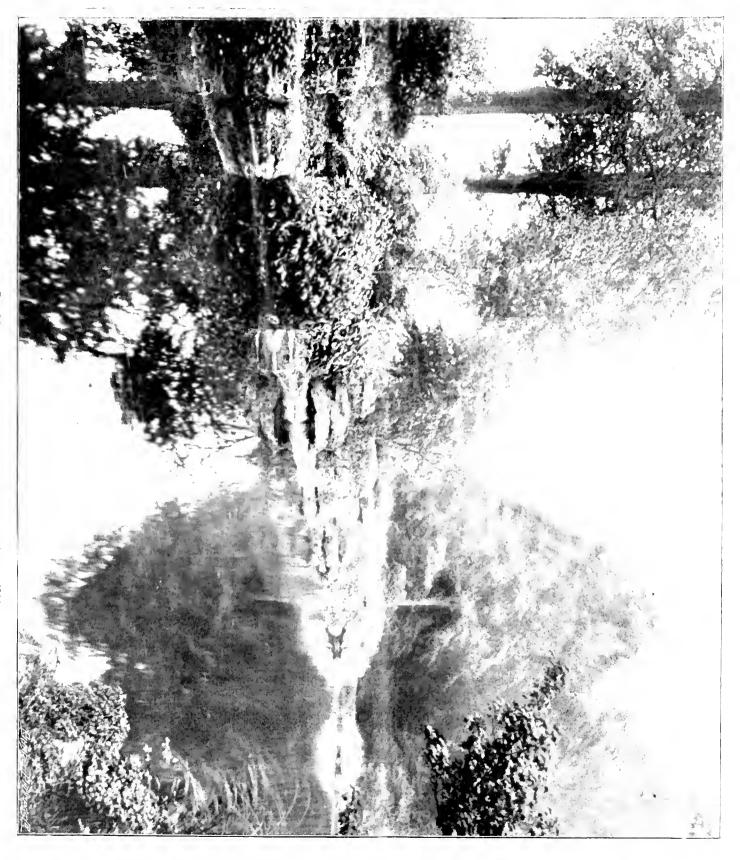

ROYAL GARDENS, KEW .- We announce with great pleasure the publication of the s cond part of the Hand-list of the trees and shrubs grown in the Arboretum. The part before us, which is published at a very low price, comprises the Gamopetalæ, the Monochlamydeae, and the Monocotyledoneæ. The utility of a carefully-compiled list of this description is enhanced by the fact that the work is not a mere compilation, but is the result of the special researches of trained experts. The nomenclature and synonymy may therefore he relied on as accurate. Ultimately we may hope the several parts may be combined into one whole, and thus form a new Hortus Kewensis.

THE "PALM-HOUSE" IN SEFTON PARK, LIVERPOOL.-We lately gave an illustration of the five Palm-house, presented to the city of Liverpool Park by Mr. YATES THOMPSON. We may now add that Messrs. Veitch & Sons have been entrusted with the task of furnishing it, and so satisfactory is the result that we purpose to give another illustration later on. The Palm House was formally made over to the citizens on the 6th inst. A statue of Parkinson adorns the building, and others are to follow.

ELEMENTARY GARDENING.—Sir JOHN GORST might possibly take a hint from Russia in developing the scope of our primary education curriculum. Apparently many primary schools, especially in the villages, have orchards and kitchen gardens attached to them, and from a recent report of a province in South Russia we gather that not only has almost every school an orchard and kitchen garden for the use of the schoolmaster, but that nearly half of the schools are already in possession of "small model

^{*} From clause 27 of the rules made by the Board of Trade with respect to applications to the Light Kulway Commissioners for orders authorising light railways, we learn that "every application to the Commissioners for an order must be made in the mouth of May or of November, except in the year 1896, when it must be made in the month of December.

kitchen gardens, orchards, tree plantations, or farms, at which gardening and sylviculture are regularly taught." The pupils are carefully initiated also into the mysteries of silkworm culture and beekeeping; and even vineyards are to be found in connection with some of the schools situated in Caucasia Besides tending to encourage the pursuit of agriculture as a calling, and so diminishing the rush of population to the towns, we cannot but feel that another important item is the effect upon the health of the children, by the interchange of sedentary with out-door studies.

NATIONAL ROSE SOCIETY.—A meeting of the General Purposes Committee will be held, by kind permission of the Horticultural Club, at their Rooms, Hotel Windsor, Victoria Street, Westminster, on Friday, the 9th inst., at 2.30 p.m., to revise and complete proofs of the Supplement to the Catalogue, and decide on suggestions to be made in it as regards some varieties now in the official catalogue. H. HOMEYWOOD D'OMBRAIN, EDWARD MAWLEY, Hon. Secretaries.

— A meeting of the General Purposes Committee will also be held, by kind permission of the Horticultural Club, at their Reoms, Hotel Windsor, Victoria Street, Westininster, on Tucsday, the 13th inst., at 2 P.M. H. HONEYWOOD D'OMBRAIN, EDWARD MAWLEY, Hon. Secretaries.

FLORA OF VENEZUELA.-The flora of this extremely rich intertropical country is being investigated by Professor H. H. RUSBY, who states that the most conspicuous of the tree family in the lower Orinoco district are members of the orders Lecythidacer, Sapotacer, Meliacer, Leguminoser, Palme, Apreynacere, and Lauriner. The Leguminoser and Bignonaceae are chiefly represented by climbing and twining plants. Soft and hard-woods, fit for a variety of useful purposes, abound, the latter being of handsome grain, and taking a good polish. About 500 species of plants were collected, the aim being to obtain thirtytwo specimens of each, in order to supply correspondents, including most of the leading universities of the United States and Europe. A number of plants have been collected likely to be of use in the arts and in medicine, and great results are expected when sufficient time has elapsed to allow of his specimens being thoroughly examined.

SUSSEX AGRICULTURAL COLLEGE, UCKFIELD. -A party of the students at the Agricultural College, Uckfield, had an experience lately of combining instruction with pleasure in a visit to Haywards Heath. The party arrived at Haywards Heath about 11.40, and with Mr. W. GOARING as guide, they visited the Applefield Nurseries. Mr. W. GOARING is the lecturer on gardening under the Technical Instruction Committee of the County Conneil. The nurseries mentioned belong to Mr. Goaring, and the students had an excellent opportunity of not only inspecting the range of grounds and glasshouses devoted largely to the culture of Tomatos and flowers, but gained a practical insight into the method of catting, packing, and despatching the flowers, &e, to market. The flowers in season were white Dahlias, yellow Marguerites, Chrysauthemums, &c. While the morning had been employed in visiting a flower farm, the afternoon was devoted to more direct agriculture in a visit, by permission of Mr. T. BANNISTER, to Sugworth Farm, where general farming and cattleraising are carried on under the direction of that practical agriculturist. Yet a further opportunity of inspecting the system of cattle-raising and management was afforded the students by the permission of Mr. Black, who has the management of the Borde Hill (Mr. STEPHENSON R. CLARKE) herds, to visit the e-tate farms. At Christmas time the animals from the Borde Hill estate are frequent prize-winners, and the students had exceptional opportunities of gaining an insight into one of the most important branches of firming. Sugworth and Borde Hill lie between Haywards Heath and Balcombe, another agreeable jount for the students, who, after their most enjoyable visit, left Haywards Heath between five and six for Uckheld.

How Customs Duties injure the Trade OF A NEIGHBOURING STATE. -- In Moravia, on the borders of the river Thaya, a tributary of the March, the peasantry cultivate Cucumbers in the fields on a great scale, the fruits finding their way all over Germany, Austria-Hungary, Bohemia, Servia. Roumania, Bulgaria, and even to America; Bohemia taking, probably, the greater quantity. The Cucumbers or Gurken are preserved in salt-andwater or in wine-vinegar and spices, the larger fruits being put into the first, and the smaller ones into the latter kind of pickle. The produce was at one time sent into Germany in large quantities at a low rate of import duty; but now that the duty on green Cucumbers has been raised to 4 marks per 100 kilog, and that on pickled Cucumbers much higher, raising the price five times as much, the trade has greatly fallen off, Moreover, if Dill, spices, or Morello Cherry leaves are found in the pickle, the importer is fined five times the value of the goods, and forfeits the same into the bargain. The cultivators in Moravia sell their Cucumbers elsewhere; it is only the subjects of the German Empire who suffer, and have to go without, or pay dearly for, their beloved "Znaimer Gurken." The average production of Cucumbers is, as we learn from the Gartenflora, 120,000 to 180,000 cwt., of which about the half are pickled in one way or another on the spot.

ZONAL PELARGONIUMS. - We have received from Messrs, H. Cannell & Sons, of the Home of Flowers, Swanley, something which, as he says show the strides made in the size of these flowers, to wit, the zonal Pelargoniums, when cultivated under glass. Accompanying these were some blooms of our very old acquaintance Tom Thumb, which, although quite eclipsed in size by the new comers, beats them all in brilliancy, and it is this, and tho long succession of flowers, that still make that old variety a favourite in many a country garden. The new varieties of zonals have colours not possessed by the older representatives of the family, and this, together with their enormous trusses, and pips of 2 inches in diameter, render them almost indispensable warm greenhouse plants in the dull season,

BOTANIC GARDEN, BASLE.—A new botanic garden is in cour-e of formation in this city. We do not know the motives for the change, but it would seem as if the new garden would have no greater area than the old, and the situation is scarcely, if at all, more open. The new garden will, however, be in proximity to the chemical and physical laboratories, the technical schools, and other University/buildings, the completeness of which, considering the size of the town, makes an Englishman, cognisant of what he has at home, feel rather humiliated. But still the contrast is not so painful as it was a few years ago.

DE VILMORIN-D'ESTIENNE.—The marriage of Midle, Elizabeth Lévèque de Vilmorin with the Vicomte d'Estienne d'Orves is announced.

"FLORA OF BERKSHIRE,"-Mr. G. C. DRUCE intends publishing a flora of this county, and invites subscriptions. If the Flora be as well done as that of the sister county of Oxfordshire, as we have no doubt will be the ease, British botanists will have reason to congratulate themselves on a valuable addition to their literature. The work, which will extend to a volume of about 500 pages, is intended to be not only a catalogue, but a history of the plants of the county. The various botanical writers since 1550 have been pretty exhaustively consulted, and no pains have been spared in personally visiting nearly every parish in the county in order to make the work as complete as possible. In the Flora about 1,000 flowering plants and Ferns will be enumerated, in addition to a large number of varieties and plants of casual occurrence. In order to show their distribution through the county more completely, Berkshire has been divided into five botanical districts, which are based upon the river drainage. The plant distribution through these,

and also through the border counties, will be shown in a tabular form. Brief sketches of the topography, the meteorology, the geology, river drainage, and the physiography of the botanical districts will be given. The work will also include short biographies of the various botanists who have investigated the Berkshire botany. The book will be published by the Clarendon Press. Mr. Druce's address is 118, High Street, Oxford.

ANGULOA CLOWESH.—Mr. ALEXANDER HAGGART of The Gardens. Moor Park. Ludlow, kindly encloses a photograph of a plant of Anguloa Clowesii that flowered under his care last spring, and which is remarkable in the number of flowers on it. This spring two breaks started from last year's pseudo-bulb, one having three blooms, and the other four, of splendid size, substance, and colour. The photograph sent in illustration is by the Hon. Lucius O'Brien, and Lairly represents the character of the plant, but is not snited for reproduction.

NEW GARDEN PLANTS OF THE YEAR 1895.

The last number of the Kew Bulletin is devoted to a catalogue of the names of all the plants introduced into cultivation in 1895. Pamphlets of this description are very apt to be mislaid. We trust, therefore, that an occasional volume will be issued, comprising the lists for several years. In any case, the cordial acknowledgments of horticulturists are due to the Kew authorities for these publications, the low price of which puts them at the disposal of every gardener.

LOCKINGE PARK AND GARDENS.

This charming estate of about 60,000 acres is, as most of our readers are aware, the property of Lord Wantage, and is situated in Berkshire. It is readily accessible from Wantage Road station on the Great Western Railway. On the occasion of a visit paid to the gardens on May 16 last, I was met by the genial head gardener, Mr. Fyfe. A well made and protty carriage-drive of about 3 miles in length leads the visitor to the house and gardens. The Park on either side is well timbered, with a somewhat undulated surface, which is made the best of, and planting on an extensive scale is being carried on. Such pretty subjects as Hippophae rhamnoides, Honeysuckle planted in clumps, red Dogwood, Laburnums, Thorns in large numbers, Gorse, and Broom, were remarked. The small village of Wantage is passed through, occupied chiefly by workmen employed on the estate, the cottages of an ornate style, provided with good gardens, the fronts gay with flowering plants at most seasous.

The comparatively new kitchen garden of 4 acres in extent is enclosed with high walls, and here evidences of good cultivation abounded, and the crops had a very thrifty appearance. The walls are well covered with perfectly trained fruit trees of various kinds, the Apricot, Peach, and Pear trees carrying fine crops of fruit. The foliage presented a yellowish hue, which is accounted for by the subsoil consisting of chalk; but this notwithstanding, Mr. Fyfe assured me most fruits, especially Pears, finish off to perfection. I was struck with the appearance of a wall covered with Morello Cherries, which afforded a contrast to the other trees, the foliage being of a deep green colour. These Morellos were carrying immense crops of fruit; and they were planted three years ago in pure leaf soil, and dressed annually since with the same material. Previous to this having been done, Morello Cherries were a failure. Large numbers of hardy herbaccous perennials are cultivated on the borders of the kitchen garden, the sides of the principal walks being lined with them, so that there is always something to interest the visitor. On the south wall a fine range of glasshouses, devoted principally to the cultivation of choice fruits, has been erected. The first and second houses entered contained Peach and Nectarine trees in robust health, and heavily cropped. The third house is an early vinery, in which the Vines were carrying a fine crop of Black Hamburgh, Foster's Seedling, and Madresfield Court Grapes, nearly ripe. The next vinery is planted with Muscat of Alexandria, a fine house, 40 feet by 22 feet; the bunches were large and very well set. The centre house of the range is of octagonal shape, and it is planted with Roses and flowering climbing plants. No. 6, a fine house of Hamburghs; No. 7, a mixed house of Grapes. The house beyond this one is a vinery newly planted with Muscat and Madresfield Court Vines, which were making excellent canes. The borders of the vineries have been overhauled by Mr. Fyfe, who has been long known as a successful grape-grower, and his reputation is not likely to suffer diminution at Lockinge. The end-house is devoted to the Fig, which is cultivated in the natural way, and the trees chiefly Brown Turkey, were heavily cropped. Nearer to the mansion a number of useful houses, pits, and frames are erected which are devoted to the cultivation of large quantities of stove and greenhouse plants, and Orchids, of which last a number of healthy plants were remarked. Melons, Cucumbers, and large quantities of bedding-plants are also cultivated in these houses. Carnations in large quantities, and especially fine Souvenir de la Malmaison and Uriah Pike, were remarked. Melon Hero of Lockinge, still the favourite variety here, is largely grown. Tomatos growing in 8-inch pots, and trained up both sides of a span-roofed house, were laden with fruits, 1) warf Champion being the variety. It may be remarked that some of the plants from this house were exhibited at the last Temple Show, Mr. Fyfe being awarded a Silver Medal for them. Other houses were filled with well-grown plants of Crotons, Dracienas, Calanthes (very fine), Clerodeudron fallax, Streptocarpus, Francisceas, &c.; the frame-ground, which is paved with wooden bricks, was well stocked with all kinds of bedding plants in process of hardening off. Flowering aunuals are grown in large numbers, and good sturdy plants were observed which had evidently been properly attended to in the matter of pricking-out, &c. ; the conservatory is a large building in which extensive alterations were being carried out.

The mansion, of red brick and stone, is pleasantly situated, and commands charming views all around, the south-west front looking on to a pretty lake, and at this point is the rock-garden, the subject of our illustration (fig. 76). As will be seen, the design has many pretty features, and is a good example of Mr. Pulbam's handiwork.

The planting hereabouts as elsewhere shows taste and judgment, and is consequently effective even now. Alpine, and other plants of low growth, cover the rocks, and fill the interstices about the rockery. Japanese Acers, which have been largely planted, are now fine objects, and the specimens of Golden Yew are wonderfully good. The small antique church is close by. The head gardener, who has occupied that post but four years, is no stranger to Lockinge, he having acted in the capacity of foreman in the gardens some twenty years ago. He then went to Thames Ditton House as head; and later, to Overstone Park, Northamptonshire, from which he was transferred to his present situation. It may therefore be taken for granted that he enjoys the confidence of Lord and Lady Wantage, and that the multifarous matters of which he has the charge, will not be neglected, E. B.

HOME CORRESPONDENCE.

ROUND AND TAPERING BEETS.—I do not think "D. T. F.'s" estimate of the relative value of Turmprooted and Carrot rooted Beets, will meet with general acceptance. Yet the Turmp-rooted forms are best for early purposes there can be no doobt whatever, and they may be regarded as best up to the end of Angust. No sooner, however, are tapering roots fully grown then these are found to give the finest colour and the most refined flesh. Flavour, too, is of the very best, and invariably best where both colour of flesh and quality are good also. Turmp-rooted Beets have not yet reached that high average perfection found in the best strains of tapering forms. We saw the other day at Chiswick that only one or two out

of probably a score were good enough to be entitled to three marks, whilst really fine-fleshed rich-coloured tapering-rooted varieties were numerous. I think that the immersion of the Carret-rooted forms into the soil tends to the production of that high excellence we so much desire. Thus, we almost invariably find roots that have a good portion of their tops above the soil to be-rather coarse. Then, those roots grown in strong rich soils, are rarely so good in colour and texture as are those grown under more moderate conditions. I have never ate more delicious Beets than some which came from a cottager's garden recently. On a number of boys' allotment gardens the other day, Nutting's Dwarf Red was not only of the most perfect form, but gave roots of great excellence. Beets are often sown too early, and either the roots become unduly large, or getting checked in hot weather, become rather hard-fleshed. When growth is quick and unchecked, then, as a rule, the roots are rich-coloured and delicious. A. D.

cockroaches.—If "L," who inquires in last week's Gardeners' Chroniele, p. 409, for a means of getting rid of cockroaches, will write to Mr. Howarth, Superintendent, Weston Park, Sheffield, this gentleman will be able to assist him. He has just banished these insects from the Sheffield Union Workhouse, where they threatened to make the place uninhabitable. The guardians and the inmates are delighted with the result. D. G.

— With reference to query from "L.," in Gardeners' Chronicle of last issue, I can state from over twenty-five years' experience, that Chase's Beetle Poison effectually cradicates cockroaches in a few days, if placed about the houses. The square eggs of cockroaches often come in the roots of imported Orchids, and if not noticed when potting-up the plants, soon fill the Orchid-houses with cockroaches. Some lumps of Chase's Eactle Poison about the stages are most effectual. E. S. B.

THE NEW FRENCH CLIMBING BEANS. - Visitors to the Temple Show of the Royal Horticultural Society in May last, will remember that in the remarkable collection set up by Messrs. Sutton & Sons of Reading, there were three climbing types of the Dwarf French Bean. I think I am right in stating there are four or more candidates for favour, but three of them only were exhibited on this occasion; and they showed their adaptability for forcing in pots, for they had made a good, vigorous growth, and were well furnished with pods. Tender-and-True is a climbing form of the well-known Canadian Wonder, and it is like the latter in all respects plus the running habit; and like the dwarf form, it produces long handsome pods. Epicure can claim some distinctness of character, and one characteristic is its abundant cropping qualities. The seeds of this variety are small in size, and of a brown colour, quite distinct from those of the preceding. Earliest of All is a new claimant to public favour, to be put into commerce next year; and it is said to be decidedly quick in turning in. The public saw the three standing side by side, and so had but small opportunity of judging which was the earliest and which the latest. I was, however, informed that the examples of Earliest of All were from seeds sown a fortnight later than those of Tender-and-True, and yet the former had pods ready to gather a fortnight sooner than the latter, while it produces its pods in larger clusters. The seeds are quite small and white. It does seem that the introduction of the foregoing varieties makes it possible to have forced Climbing Beans with as much ease as the dwarf types, and quite as early. R. D.

EXTRAORDINARY RAINFALL OF SEPTEMBER.—The month of September just past has given, in the neighbourhood of Harpenden. Hertfor Ishire, a most exceptional rainfall, amounting, according to Sir John Lawes' Rothamsted gauge, to \$1077 mehes, which is equal to the enormous quantity of \$15\frac{3}{4}\$ tons of water on each acre of land. The average fall for September in this district is about 2\frac{1}{2}\$ inches, or 25\frac{1}{2}\$ tons of rain per acre, so that there has been received in the past mouth 55\frac{1}{2}\$ tons in excess of the normal fall. This exceptional rainfall has broken the record, for since the Rothamsted rain-gauge was constructed in 185\frac{3}{2}\$, that is forty-three years ago, no mouth his given so large a rainfall. The nearest approach to it was in October, 1805, when 7\frac{3}{2}6\$ inches of water fell; the next heaviest rainfalls were in July, 1855, when 6.96 inches fell; and in August, 1870, when 6.65 inches were recorded. J. J. Willis, Harpendin.

SWEET PEA CUPID.—This Pea, as with "A. M." and Michael Cuthbertson (see Gardeners' Chronicle

pp. 341 and 404), has been a complete failure here. I had nearly 200 plants growing in beds in the flowergarden, and there were not a hundred flowers expanded on the whole lot during the season. The habit of the plant is everything to be desired for an edging-plant, being very dwarf and prostrate. It also shows an abundance of flower-buds, but nearly every one drops off just before it should expand. This is a great pity, and a disappointment, too, as it would have been an acquisition for the embellishment of the flower-garden had the flowers come to perfection, as we have so few good dwarf white-flowering plants suitable for flower-beds. I have seen this Pea growing in several places I have visited this season, and in each it behaved in the same manner as with me. J. H. W. [We read similar complaints about the plant in German periodicals, and the plant is there being recommended for filling window-boxes, and growing under glass. By sowing it early in pots, and getting it into bloom early, it might be used out of-doors in a variety of ways. Ed.]

HYBRID CYPRIPEDIUMS .- Au interesting discussion could be raised on the subject, giving the period clapsing between fertilisation and germination, ascertaining whether the seed-parent does not exercise a more powerful influence than the pollen-parent; whether some species have not a closer affinity towards whether some species have not a closer affinity towards each other than others, and thus cause a speedier result, &c. Have the "offspring" of Cypripedium and Selenipedium been successfully flowered? I have been told by some No, by others Yes, and that when they flower it will always prove the same as the seedbearing plant. Still, "Nil Desperandum," and I mean to persevere. I can only give my experience so far as I have yet gone in raising plants between the Cypripedium and Selenipedium, and I think you will agree with mc when I say that a record has been established. In December, 1894, I pollenised S. Schlimi with C. Spicerianum; the seed-pod was ripo about the beginning of March, and seed was sown; in about four months it germinate t, and I now have healthy plants with about six leaves. Again, in December, 1895, I pollenised S. Dominianum with C. Chamberlainianum; the seed-pod was ripe in March, and seed sown. In May it had germinated, and there were plants some with leaves a quarter of an inch long, while now, at the end of September, there are strong, vigorous-growing plants, with three and four leaves, some of which are over 5 inches long, bearing a decidedly Selempedian character, whereas in the former cross the leaves are short, though pointed, but bearing no resemblance to a Sel-nipedium leaf, and by no means of such vigorous habit as those of the Chamberlainianuum and Dominianum cross, which induces me to believe that Cypripediums of the Chamberlainianum and Victoria Marie species have more affinity with the Selenipe liums, and hence grow away more rapidly. Shall I ever flower those' mains to be seen. I will only add, the reverse cross was tried in both these instances, and though the pod ripened in about twelve months (the usual time for most Cyrripediums, the seed failed to germinate. T. W. Swinburne, Winchcombe, Cheltenham

WHITE AND YELLOW-FLESHED TURNIPS.—
Though not a resident in the North, I would like to say a few words of praise in favour of yellow-fleshed Turnips, e-pecially for winter and spring use. As regards my own taste I certainly prefer the variety named Golden Ball, and I have never had any complaint from the cook on account of its colour. I sow the seed of this variety in the third or fourth week in July, which are nice bulbs at this season, and will continue to increase in size for some time louger. I find them most useful for spring use, and I have kept them so late as the middle of June, and then they were really good for flavouring purposes. In my opinion, a good yellow Turnip is much better flavoured than a good white one. J. Mayne, Bicton.

FAILURE OF NARCISSUS HORSFIELDI.—I find, as I also found last year, that my bulbs of Narcissus Horsfieldi are affected with basal-rot. Is the constitution of this variety not standing the strain of cultivation? Can any of your readers say if basal-rot is general in N. Horsfieldi. The bulbs have, I notice, been increasing in size and fleshiness, especially those grown in Holland. When basal-rot did start in bulbs of this nature, it would develop quickly. It is, perhaps a case of over-cultivation with N. Horsfieldi, which was a bulb of a very strong constitution; but if grown continually on rich soil to increase its size, as there is a craze for large bulbs, it perhaps has reached its limit, and declines further artificial treatment. Can some of your correspondents give their opinion! Calyar.

MAIZE, OR INDIAN CORN.—I received from the United States of Columbia some Indian Corn. I was told that it produced a plaut which would not be found in any other part of the world, so far as records went up to the present time. I planted a few of the seeds, and put them out in the garden very late in the year. These plants have grown up to be 10 feet high, and they are of most gigantic proportions. They are S to 9 mehes in circumference some way up the stem; some have black stems, some green. There is no sign yet of their flowering, but they are still growing. The stem is covered with hair, and they present, to my mind, a most remarkable appearance. If you could tell me who would be likely to be interested in such a subject, I should be much obliged. Twos. Christy.

THE LATE WILLIAM MORRIS.—It has been well said of him who joined the great majority on Saturday last, that his poetry or a great part of it) exists for precisely the same purpose as his tapestries, flowered linens, and silken embroideries, to express the beauty of colour, line, and material. That he was an ardent admirer of Nature, having an intense joy in natural beauty, is evidenced by a perusal of some of his works. The following lines show his admiration of trees, &c.:—

"And all about were dotted leafy trees—
The Elm for shade, the Linden for the bees;
The noble Oak, long ready for the steel
That in that place it had no fear to feel;
The Pomegranate, the Apple, and the Pear,
That fruit and flowers at once made shift to rear;
Not yet decayed, therefore, and in them hung
Bright birds that elsewhere sing not, but here sung
As sweetly as the small brown nightingales
Within the wooded deep Laconian vales."

Kelmscott House. Hammersmith, where le lived, faces the Thames, and is fronted by some fine old Elms, planted very many years ago by the "Ecclesiastical Commissioners:" and now, when the leaves are falling from these old monarchs in the tree way, one recalls his pictures of the months in "The Earthly Paradise"—pictures which are amongst some of the most beautiful in literature. "October" is immortalised in the following lines:—

"Oh, hearken, hearken! through the afternoon, The grey tower sings a strange old tinkling tune, Sweet, sweet, and sad the toiling year's last breath, Too satiate of life to strive with death. And we, too—will it not be soft and kind, That rest from life, from patience, and from pain, That rest from bliss we know not when we find. That rest from love that ne'er the end can gain' Hark, how the tune swells, that erewhile did wane' Look up, love—ah, cling close and never move' How can I have enough of life and love."

Did his Elm-embowered residence—facing the "Silvery Thames"—suggest those lines of his ou "London," wherein he says:—

"And dream of Londou, small and white and clean, The clear Thames bordered by its gardens green."

Whatever he touched he gave life and beauty to: even out of such an ordinarily dull and prosaic thing as a mill he could find something animate and cheery to write about, as:—

"O'er the oily smooth mill head,
There hung the Apples growing red;
And many an ancient Apple-tree
Within the orchard could he see:
While the smooth mill-walls white and black,
Shook to the great wheels' measured clack,
And grumble of the gear within.
While o'er the roof that dulled that din,
The doves sat cooing half the day,
And round the half-cut stack of hay.
The sparrows fluttered twittering " J. E.

GRAPES AT THE CRYSTAL PALACE.—It seemed to be generally held that the Grape classes at the recent Crystal Palace show suffered a good deal from the nature of the tabling used, and by which hey were too much broken up. Where there are several lots of bunches on one side, some on auother, and others on a third, not only is effect greatly mured, but accurate decisions are rendered very difficult. When Grapes in any one class are all arranged on one face, then it is much more to saible to compare bunch with bunch, and to get an estimate of relative quality. Because of the disconnection of the centre square of tables it was needful in some cases to have classes so broken, that some bunches of one class were on one table, and come on another. That is a method of arranging

Grapes that should never be tolerated. Doubtless it was due to the prevalent fashion of arranging the tables at the Palace, but every one must admit that tables should be accommodated to the exhibits, and not the exhibits to the tables. If the tabling be staged by the Crystal Palace employes without reference to the Royal Horticultural Society, then the mistake is easy to understand. Probably it is but needful to point out the error to have it so far remedied, that in all cases the tabling shall be so arranged as that any one class of anything-Grapes or otherwise-shall always have one face only. broken tabling in the lower part of the nave of the Palace answers admirably for the trade collections the raisee answers admirably for the diale conections of fruits, &c.: but for the smaller competitive classes above the transept it worked badly. Next year it is hoped the utilitarian will take the place of what is just now regarded as the picturesque. If, however, centre tables or benches are insisted upon, better fill them with plants or fruit trophies than with small competitive exhibits. A judge is reported to have said, in relation to the Muscat Grapes shown, that some bunches nearly approached the high standard of perfection in shape. This remark naturally raises the not uninteresting one as to how far in making awards all other things in berry, colour, and finish, but not mere size of bunch being equal, contour or form in bunches, that is of the recognised character of the variety, should have weight. I could but notice how many nearly handsome bunches there were at the Palace that would have been much more so, had undesirable shoulders been early removed, or a few berries here and there cut out, that would unduly break form or contour, without adding anything to merit. I think form or outline in a bunch a great merit. Others seem to think bulk in a bunch to be of far more consequence. But judging bunches for weight is a matter for the scales, and not for intelligent men. The 1st and 2nd prize bunches in the Alicante class presented a case in point, one having ungainly size, the other handsome form and finish. The handsomest bunch in the Muscat of Alexandria class was not the largest on the 1st prize board. All on the 2nd prize board lacked form; and in the next, one bunch was handsome, and a second would have been but for an unhappy shoulder. Not the biggest, but certainly the best finished and prettiest bunches of Museats, were those shown by Mr. Goodacre in the largest class; indeed, this exhibitor seemed to have a generally good appreciation for form in bunch, irrespective of mere size in berry or bunch. Some very ungainly bunches were shown in the larger fruit collections, although I do not know where weight in judging was given for or against in consequence: the best bunches were Mr. McIndoe's Gros Maroc and Mr. Goodaere's Alicinte. I have been looking over the illustrations of various Grapes found in Mr. Barrou's book on the Vine. I find there that by far the larger number, intended, no doubt, to present typical bunches, are shoulderless, and are generally of hand-some form or outline. No harm would be done if Grape exhibitors, and especially the younger ones, would study these illustrations, and seek to bring their best bunches somewhat into line with them. A judicious use of the scissors should help to bring them into the form desired without materially sacrificing berries. It very often happens that small defects of this nature cannot be seen until on the board; but a closer study of correct form would enable many faults to be detected on the bunch whilst yet hanging on the Vine. Objection was taken Grapes, on the ground that the first colours very early, whilst the latter is difficult to colour, hence it needs greater skill in cultivation. Then Gros Maroc is, relative to quality, so poor a Grape, that it does not seem worthy of a class; whilst good, well-finished Gros Colmars really are very meritorious. A. D. [We do not think the natural form should be interfered with more than can be avoided. Ed.]

SOCIETIES.

ROYAL HORTICULTURAL.

OCTOBER 1, 2, a.—At the show of British grown fruits held at the Crystal Palace on the above dates, and reported in our last issue, were the following honorary exhibits which may now be mentioned:—

From South Wides came one of the very finest collections of Apples in the show. It was the produce of WM. Bythway, Esq. Warborough, Lianelly 1gr., Mr Wilkins). The collection included upwards of ninety dishes, and in many cases the varieties were represented by fruits superior to those included in any other exhibit. There were twenty-nve

excellent fruits of Peasgood's Nonsuch, said to have come from one small tree; and the King of the Pippins, Grand Duke Constantine, Mere de Menage, Bismarck, and, indeed, most of the varieties, were of especial merit.

Messrs. C. Lee & Sov., Hammersmith Road, and Ealing Dean, had an exhibit of Pears and Apples in dishes and baskets, relieved in the centre by the use of a few Palms and other foliage plants. There was considerable variety represented by the exhibit, both Pears and Apples being numerous, and many of them were of fine quality.

Messrs. Jos. CPEAL & SONS, Lowfield Nurseries, Crawley, displayed a fine lot of fruits of Apples and Pears upon one of the centre tables, and a few young plants of Bismarck Apple, also carrying a fine crop of fruits. Upwards of 150 dishes and varieties were staged, amongst which there were some fine samples indeed.

Messes, Jos. Cheal & Sons made a display of Dahlia blooms.

Mr. W. HORNE, farmer and fruit grower, Perry Hill, Cliffe, Rochester, exhibited commendable fruits of a dozen varieties of Apples.

Messrs, Garver & Sons, Attleborough, Norfolk, had one of the tables occupied with a cone-like wooden stage, upon which was displayed a number of dishes of Apples and samples of their Norfolk cyder.

Mr. JNO. WATKINS, Pomona Farm, near Herelord, made display of b ight-coloured cyder Apples, and bottles of cyder. Messrs. PACL & SON, The Old Nurseries, Cheshunt, bad a corner table laden with produce from their establishment, which included Apples and Pears in considerable variety.

Messrs. S Spooner & Sons, Hounslow Nursery, Middlesex, exhibited about fifty dishes and baskets of fruits upon one of the side tables. Many of the dishes of Apples and Pears were of very commendable quality. King of the Pippins, Hoary Morning, Golden Noble, Duchess' Favourite, Cox's Orange Pippin, Carlisle Castle, Blenheim Orange, Margil, Lady Henotker, and Warner's King may be mentioned among some of the best.

Messrs. T. Rivers & Sox, Sawbridgeworth, added greatly to the attractiveness of their exhibit, by the inclusion of some finely-fruited orchard-house trees in pots, which they arranged along the centre of the table. Among these were trees of Emperor Alexander, Sutton Beauty, Melon, Bismarck. Remette Doré de Hensen, Bijou, and Belle de Meguy Apples; and Conference, Doyenne du Comiee, Passe Colmar, and Marie Louise Pears. A tree of Rivers' Late Orange Flum, laden with fruits, was most attractive. The fruits in dishes were of very high merit, and we may instance the following:—Pears, Beurré Superfin, Princess, Doyenne Boussociu, Pitmas'on Duchess, Doyenué du Comice, Emille d'Ileyst, Biyou, Marie Louise d'Uccle, Brown Beurré, Louise Boune of Jersey, and Conference. Apples, Emperor Alexander, Rivers' Codlin, Lane's Prince Albert, Cox's Orange Pippin, New Hawthornden, Bismarck, Ribston, Buckingham, Peasgool's Nonsuch, Belle Dubois (very fine), King of Tomkin's County, The Queen, Washington, and Blenheim Orange. Black Alicante and other Grapes were capital; and of Plums there were Wyedale, Grand Ituke, Antumn Beauty, Monarch, Coe's Golden Drop, and several seedlings: Lady Palmerston and Salway Peaches were also good.

The exhibit from Messrs. Jno. Laino & Sons was displayed upon a long table, the surface of which was covered with white piper. In the centre was an elevated ridge, facing either way, and running about three parts the length of the table. This was packed on either side with handsome Apples, except in the centre, where some bunches of Grapes were displayed. The top of the ridge was a narrow flat surface, and upon this were dishes of Apples, and a few small foliage plants. The rest of the table space was covered with dishes of Apples and Pears. Some of the varieties most displayed, and of better quality, were King of the Pippius, Cellini, Blenheim Grange, Peasgood's Nonsuch, Wellington, Cox's Pomona, Cox's Grange Pippin, Worcester Pearmain, Emperor Alexander, Wealthy, Scarlet Pearmain, Beaumann's Red Reiuette, Ribston Pippin, Newtown Wonder, &c. Of Pears, we noticed Beurré Bose, Beurré Diel, Pitmaston Duchess, Conference, Orange Bergamotte, Marie Louise, Louise Bonne of Jersey, and others.

Messrs. Laing had also a group of choice plants of various descriptions, and including a number of Begonias in flower. The effect of the group was unusually good. Another exhibit from the same establishment consisted of hardy flowers.

from the same establishment consisted of hardy flowers.

Messrs, Jas. Vetten & Sons, King's Boad, Chelsea, made a large exhibit of Apples and Fears, and a few miscellaneous fruits. These were placed upon several tables, and the Pears represented upwards of ninety varieties. Amongst them we noticed flue specimens of Louise Bonne of Jersey, Gansel's Bergamotte, Pitmaston Duchess, Doyonné du Comice, Beurré Baltet Père, Dr. Hogg, Princess, excellent fruits of Thompson's, also Beurré Fouqueray, Beurré Bacheler, Magnate, fine fruits of Beurré Superfin, Marie Benoist, Gedley's Beurré, Pelle Julie, Baronne de Mello, and others

her, Magnate, the fruits of Beutré Superin, Marie Benoist, Gedley's Beutré, Pelle Julie, Baronne de Mello, and others. The collection of Apples comprised a hundred varieties, and was marakable fir a tray containing forty-eight fruits of Cox's Grange Pippin, unusually good in size, appearance, and collunt; Tyler's Kernel was also well exhibited, and Bismarck Golden Noble, Cellini Pippin, Peasgood's Nonsuch, King of the Pippins, Warner's King, Blenheim Orange, Prognore Prolific, Bramley's Seedling, and others. All of the Pears and Apples shown were from pyramids in the open. Ten varieties of Plums were from the open also, but some othem were rather over ripe, Coe's Late Red, Belle de Septembre, Wyedale, and Monarch, were in good condition. A few Pigs, Cherries, &c. Three bunches of a new black Grape,

Royal Leamington, were shown. The variety may be valuable, but he spec mens were not fully ripe

Messrs, Jas. Veitch & Sons had also a table devoted to a llection of Nerine Fothergilli major in flower, a variety with very fine brilliantly-coloured flowers. The plants were good specimens, and bore a capital lot of blooms.

Another of Messrs, Verreit's tables was occupied with an exhibit of sprays from berried plants, and a capital range of variety was illustrated

From the Chiswick Gardens of the Royal Horticultural ociety was exhibited a collection of fine Grapes, and some dishes of varieties of Pears known to be good ones.

A fine lot of fruits of the variety Duke of York Tomato was

hown by Messrs. Fellowes & Ryder, Orpington, Kent.

Messrs. J. R. Pearson & Sons, Chilwell, near Nottingham,

who we twenty-four dishes and baskets of the Apple Newton Wonder; a capital variety well exhibited.

A large display of fruits of the Young's Eclipse variety of Tomato was made by Messrs. Young & Doblinon, Stevenage,

From the Horticultural College, Swanley, Kent, was exhibited a quantity of produce of good quality, and included numerous varieties of Apples and Pears, excellent Grapes,

numerous varieties of Apples and Pears, excellent Grapes, also Tomatos, Nuts, &c.

Mr. T. S. Wark had large exhibits of Dahlia blooms and Begonias; and Mr. J. R. Box, Croydon, made an extensive exhibit of double and single-flowering Begonia plants, all of which were seedling varieties, and of a good strain.

Mr. B. Walls, The Fruit Nors-ries, Crawley, exhibited some dishes of Apples, Messrs, Wood & Sons, Wood Green.

N., had a stand devoted to horthcultural sundries, including peat of first-rate quality; and the pat-nt Storing-trays known as "Our's," and described by us when reporting the show held last year, were again placed before the notice of

THE CONFERENCES.

FRUIT AS FOOD.

On Thursday a Conference was held in the Terrace Hall of the Crystal Palace, when Mr. EDMEND J. BAILLIE, of Chester, read a paper on "The Importance of British Fruitgrowing from a Food Point of View." Mr GEO, BUNYARD presided, and there was an excellent attendance of the general public,

Mr. Baillie said the subject suggested consideration in a direction somewhat different from that in which usually the thoughts of the Fellows and friends of that Society were finited. In dealing with a necessary requirement of the great human tamily—food, there might be different views as to what might constitute the necessaries and the bixnries of life. He held that fruit- which included all the cerests, such as Wheat, Outs, and so on-was the highest form of food for the human family, that was to say those portions of plants which did not come into direct contact with the soil or with manurial agents, but which were borne, carried, developed, and matured in the air and sunlight, and as a rule had within them the vital properties of the renewal of the life of the species in some form or another. The importance of home-grown fruit would never be rightly realised until the great masses of the population, especially in the denser centres, were better educated in questions, first of household thrift, and economy in labits of domestic cleanliness, and in the realization of the importance of happy healthy environment, and until they were schooled and practised in the better methods of cookery, which would imply and compel the immediate revision of their pre-conceived notions of relative values of food stuffs, and would introduce them forcibly to the importance of right dietetic principles as applied to cottage homes and the needs of the working population generally. What-ever were their opinions on the subject of fruit as food, he felt sure they would agree that flesh-foods in well-ordered households even formed a too important and constant item of diet, and that with the working-classes fruit as food was practically unknown. In the great advance in the so called education of the people this question had been passed over, and one had only to gain access to the home of an ordinary working-man, or to become sufficiently friendly to get near him at his dinner-time, to see upon what sorry stuff he had to hear the burden and heat of a labour-day. The Royal Horticultured Society, which had done so much noble work in the past, would add still greener laurels to its wreath if it would help the work of existing organisations bent upon the improve-ment of the economic aspect of the condition of the people. The claims he advocated tended to the employment of labour in healthy occupations, and the energies of labour so happily and wisely directed would have for their ultimate end the wealthier, happier, life of the people of the earth. He would f in hope that they would determine that these considera-tions now well worth their closer and more serious attention Unless they grappled with them, they could never rightly realise the importance of British fruit growing from a food point of view.

Mr ROUPELL, Norwood, speaking as an experienced fruit grower, said he always listened with the greatest pleasure and profit to Mr. Baillie. Alluding specially to Tomatos, he said the fact that such large quantities were being consumed was something to be thankful for. Nothing had surprised him so much as the rapid growth of the taste for that fruit. He remembered the time when Tomatos were looked upon as very little superior in flavour to the Potato-apple, but now the demand exceeded the supply. Of course, he was speaking of sound, ripe fruit, and not of the subbish that was put upon the arket.

With reference to the views of regeturians, he could not help thinking that a Norfolk dumpling was greatly improved by the addition of a little bit of beef-surt; and he noticed that vegetarians spoke as if they eschewed everything but vegetable food, while at the same time indulging

in milk, cheese, and sometimes good beef gravy.

With regard to the planting of Apples, he said his experience had shown that if they had a fairly good soil and used he Paradise stock, they would get a crop the second year after planting, and might book for an average crop every year after. If one sort did not bear, another would, and it was only necessary to select these of zood qualities. The old varieties were now out of date, and a nurseryman would be only too glad to obliterate them from the list altogether. That, however, could not be done, because gardeners are continu-lly asked by some old fashioned persons for a particular variety they were fond of when boys. With Cov's Orange Pippin, the American Mother, and one or two other varieties, they could dispense with the old Ribston. A dozen varieties of Apples might be grown in an average garden, but core should be taken that the soil was not exhausted, as was too

should be taken that the soil was not exhausted, as was too often the case, before planting took, place.

Mr. Besniva, Busselley, Mond, spoke of the enormous benefits which would accrue to the coal-miners and other hard workers in his district, if they made a freer use of the Apple. He considered growers had got beyond the stage of carping criticism, and he was certain they could out do the foreigner in the way of cultivation. Of his own exhibits at the present show not a single tree was almost not a single tree. was planted nine years ago, and he was so satisfied with his experiments that he would continue them. Most of his exhibits were grown on the Paradise stock, which was much better than the old Crab-tree stock. A very much finer fruit was obtained, and they could depend upon it that if they were to hold their own in face of the large importation of front, they must make up their minds to grow something superior to the foreign article. If they dilthat, fidence in the future of the British fruit-grower. If they did that, he had con-

Mr. Bythewey (Llanelly), who had some fine fruit in the show, in reply to the Charman, said he had never grown under glass, and he certainly did not believe in walls. He considered that South Wides was the country for Applegrowing, on account of its moisture. America had the colour, "but," added the speaker, "I beat the Americans this time. I might say," he cided, "that I live in a gide of wind; and if I can grow, anyone with the needful enthusiasin and love for the callings and do as well."

Mr. A. H. Pereson proposed a vote of thanks to Mr. Bailie, and said that the trust they saw that day showed that Mr. Bytheway had the essistance of something other than the gale of wind he spoke of. The vote having been carried, thanks were also be orded to Mr. Bunyard for presiding, and the Conference adjourned till the following day.

SECOND DAY'S CONFERENCE.

THE CIDER AND PERRY INDUSTRY

OS Friday, October 2, Mr. Raus UFFB Cook, M.P., read a paper on the subject of cider on I perry, dealing with the process of manufacture, and suggesting means for the extension of the industry. Mr Geo BONVARD presided in the absence of Sir Trevor Lawrence, who sent a telegron regretting that he was unable to be present through indisposition.

Mr. Cook said he had no doubt that it was in conse-

Mr. Cook said he hal no doubt that it was in consequence of the public interest he had taken in the promotion of the cider and perry industry that he had been honoured with an invitation to read a paper on the subject before the Royd Horticultural Society. He had long been of epimen that the cider industry was one capable of considerable development, and from which farmers might derive more specific than their data or. The industry was formally more profit than they did now. The industry was formerly one of great importance. Dr. Beale, a distinguished hornculturist, who wrote in the second half of the seventeenth century. declared that Herefordshire orchards were a pattern for all England, and Evelyn, somewhat later in the same century, said that the same county had become one entire orchard. The same Dr. Beale extelled the order produced, and alluded the same of beare exhibit the spirit produced, and and do to the fact that King Charles I, with the gentry who were brought thither as prisoners, preferred it before the best wines those parts afforded. The industry of eider and perrymaking was a profitable one throughout the eighteenth and into the early part of the unicted th century declined for two reasons. During the French war the price of corn and meat was very high, and farmers, turning their attention to corn-growing and cattle-raising, grubbed up their orchards, and as other agricultural produce became more profitable, they neglected to keep up such orchards as were allowed to remain. The second reason was the selfish were allowed to remain. The second reason was the selfish and suicidal conduct of the cider merchants and middlemen, who, after bringing the liquor form the farmer at a low price, thinned it with water, making, as the saying went, five hogs-heads out of three, and fortified it in order to disguise their malpractices, and make stuff stufficiently pa atable to sell in Bristol and London, which were the chief centres of the The result was to bring eider into general discredit with the public, and a timately lessen the demand. There was this to be said for the lider and perry industry, it was at the present moment the only agricultural industry which appeared to be capable of development to an almost unlimited extent, and in which we were, in a great degree, not as yet seriously endanged by foreign competition. It was therefore a hopeful industry, and there was every reason to believe that once the merits of good cider and perry were generally known, the demand would result in these drinks taking the place, not indeed of good wholesome pure beer, but of the many artificial bever ges by which the taste of the

public was now so sadly vitfated. The industry was still one of much more importance than was generally supposed. The principal cider and perry producing counties of England were Devon, Hereford, Somerset, Worcester, and Gloudester. In area under orchards in these counties were 11% 4% a res in 1844, and 116,192 in 1895, an increase of 1,147 teres. Cider was also made in the five neighbouring counties of ternwall, Dorset, Manmouth, Shropshire, and Wiltshire; and it had been circulated that the area under orcharling amounted to about 140,000 acres. The authors of that great work, The to so int 140,00 acres. The authors of that great work, 16-Her fords, re Powma, gave as an average yield a low average) of liquor per acre of 200 gallons, and the average price 2d. a gallon. He considered this considerably below the true figures. He would put the yield at 300 gallons per acre, and the price 3d, per gallon. The total production would be that the industry was a considerable one. Having described that the hiristry was a considerable one. If a ring describes the process of manufacture, he said all Apples and Pears would not make good cider and perry. The process of making was simple, and resembled that of wine-making. Fermentation was the most difficult stage in the process. Eather it was unduly delayed by cold or by a deficiency of sugar in the fruit; or, what was more often the case, it was persistent, and continued so long as ultimately to exhaust all the sugar in the cider, and render it hard; and it might proce d a stage further and become actous, when of course proce d a stage infther and become actors, when of course the liquor was rained, and practically became vinegar. Ex-perience could overcome these difficulties to an extent, but the knowledge was more or less superficial, and not being founded on scientific principles, it too often died with those who practised it. All manufacturers had much to learn. There were two systems of older making, originating in the endeavour to overcome the difficulties of fermentation, especially the tendency to the conversion of all the natural rugar of the fruit into alcohol. By the first system—the natural system—fermentation was checked before all the sugar had been converted into alcohol, and the resulting begoor was bettled, or sent out on draught, with a sufficient rtion of its natural sweetness remaining in it to render it palacable to the general public. By the second system, the higher was fermented to dryness, that was to say, all the sugar was concerted into decolod, and in order to render it acceptable, it was afterwards sweetened by the addition of a substance, such is succharin, which would not set up fresh fermentation, and it it was wanting in flavour, some flavourne substance was added also. Both systems had their votaries. The second was the easier of the two, but he greatly preferred the first, and it was of cider and perry so made that he ventured to extol the ments as wholesome beverages. He recommended these drinks because they were natural drinks, made from the purce of tipe fruits without the admixture of any fereign substance, pleas art to the palate, tofreshing, and of low alcoholic strength - Ordinary cider, such as would be acceptable to the general public, tarely contained as much as 4 per cent, of alcohol. Having spoken of the medicinal qualities of these dunks, be proceeded to consider the industrial value of the trade, and the benefits which would accuse to the farmers who had orchards. In years of abundance, truit (Apples and Pears) was too often left to rot on the ground for want of a demand. There was no difficulty in selling really good sound liquor, and there could be no doubt that its manufacture was dready being taken up in different parts of the United Kingdom and our colonies. As to there being no fear of outside competition, he might be asked to justify his opinion in face of the considerable importation of Tride returns did not support the view that the English markets were in immediate danger of being swamped by American color. Be hoped that the red reason why the importation of American cider had not increased to the extent at one time feared was to be found in the inferior quality of the article compared with that produced at home Much of the American cider imported into this country was Pastennsed, and so had to be artificially aerded after its arrival. If not l'asteurised, a chemical preservative, such as solucylic acid or be acid and, had to be added to it, in order to enable it to bear the voyage. He was not sufficiently versed in chemistry to say what might be the effect on the human system of continued doses of these drugs, which formed the basis of most of the secret mostrums sold to other makers for the doctoring of the liquor, but as the object of using them was to enable in erior drink, or drink already on the turn, to be passed oil as good, he thought their use should either be prohibited, as was already the case in some countries, or that a statement of the kind and quality of the agent employed should appear on a label attached to the article sold.

To obtain a regular supply of good English eider and percy, the first thing to be done was to removate our orchards, destroy the old and worthless trees, and replace them with the most approved vintage fraits, which experience had shown to be suited to a given locality He advocated penal legislation, which would affect those persons who would not properly look after their trees, as was the case in Tasmania; he also considered that at least two experimental establishments should be started in the country at the cost of the State; that the cost of carriage for cider should be reduced, for which purpose the State should acquire the counts; and that the Adulteration Acts should be more rigidly entorced.

The Chairm in asked how s on young eider trees came into bearing

Mr. JOHN WATKINS, Hereford, in reply, said that few sorts of eider trees were early bearers, but if a good fruit was wanted it was worth waiting for. They must all be

thankful to Mr. Cook for his comprehensive paper. He himself was a cider-maker, and he found no difficulty in sell-ing his best cider—the demand practically speaking, was unlimited. Of course, in a large business there was always an amount of liquor which had to be sold at a cheaper rate. but it was not the class of eider he wished to develop. If the public required a good article they should be prepared to pay for it. Much cider was sold that was quite innocent of Apple juice at all!

Mr. GAYMER, Norfolk, expressed the pleasure he had experienced in listening to the paper. He spoke of some American cider having been analysed. He would not, he said, state what the result of the analysis was, but if the public would only have some analysed—und the cost was next to nothing-they would be surprised at the result '

Mr. Till, Kent, asked if an Apple could be recommended that would do for cider as well as for culmary purposes.

Mr. Watkins said there were several varieties, and promised to supply a list to the Secretary of the Royal Harticultural Society.

Mr. A. DEAN, Kingston, suggested that no license for ale dialic liquors should be issued in this country unless the person seeking the license would undertake to sell cider. That would put the brewers on their mettle, especially as they were doing all in their power to "tie" as many houses

as possing.

Mr. Cook said the question of "tied" houses was one he had considered. He had been informed that certain browers were going to take up the trule and sell cider as well as

Mr. Devn.-Not their own manufacture?

Mr. Cook.-1 hope not. He added that the middleman derived too great a benefit from the cider trule at the exderived too great a benefit from the cider trade at the expense of the farmer. At a certain hotel in London, he had to pry 2s, a quart for cider, as a gallon! He wrote to the directors, who said that a mistake had been going on for some years and the price was reduced to one-half. In Hereford, where they ought to know better, he had been charged 1s. 6d. a quart; and in another town he had to pay for American cider at the rate of 5s. 8d. a gallon, atthough it was said to deduce in this counter at from soft on although it was sold to de ders in this country at from 5d. to

The Chairman, in proposing a vote of thanks to Mr. Cook, said they were all indebted to that gentleman for the energetic action he was taking to ruise the industry. He was glad to see that Mr. Cook was going in for a really good article as, as had been said, there were some sorts of cider that should only be approached with prayer and meditation. He hoped a faste would be revived for a good wholesome liquor from which the health and the pocket of the community

The vote was carried enthusiastically, and the Conference

(To be continued).

DEVON AND EXETER GARDENERS' ASSOCIATION.

SEPTEMBER 30.-The annual meeting of the members of this association took place in the Guildhall on the above date, the Right Worshipful the Mayor of Exetic presiding.

The Hon-Secretary Mr. A. Hora read the committee's report for the session 1895-96, which stated that in the beginning of the sixth year of the existence of this Association the ining of the sixth year of the existing position of looking back upon its work with genine satisfaction, and looking hopefully to the future. The report referred to the fact that a branch of the Gardeners' Royal Benevolent Institution had been formed in Exeter, with an influential and comprehensive committee. The Spring Flower Show was referred to as a great success. The committee recommended that it be an annual fixture. The committee acknowledged handsome annual return. The commutee acknowledged manasone gifts to the library, one being a presentation copy of ATravelpr's Notes; or, Travels Royal the World in Pursuit of Hoctwaltural Knowledge, by Mr. James H. Veitch, of the Royal Exotic Nurseries, Chelsea, presented by the author.

NATIONAL CHRYSANTHEMUM.

therogen 6, 7, 8 -The second show of the season, under the auspices of this society, was commenced in the Royal Aquaritm on Tuesday last. We regret that in a measure it must be written a poor display, and it certainly bore no comparison with the splendid exhibition that took place in October list year. We were prepared to expect only a moderate display, for the unfavourable character of the weather latterly has been notorious, but in most of the classes there was little competition indeed, and of Pompons there was not an exhibit worthy of mention in these columns. It would be disappointing if the success of the forthcoming Jubilee Exhibition were in proportion to that under notice, but this may not necessarily be so, for the weather has delayed the plants in a manner quite unexpectedly, and in November there may be an abundance of exhibition blooms. On the other hand, bowever, there is an impression that Chrysanthemums will not be phenominally good this autumn, or as first-rate as the Society would wish upon the occasion of the Jubilee.

The group of Chrysauthemum and foliage plants had to be arranged upon a space of 72 superficial feet. There were three exhibits of considerable merit, and the 1st prize was obtained by Mr. H. J. Jones. Ryceroft Nursery, Hither Green, Lewisham, whose arrangement showed excellent taste. The

blooms upon the Chrysinthemums were not crowded, but were of fine quality, and the Crotons, Drace as, and Ferns, with which the group was embellished, were disposed in an effective manner. Mr. W. Wells, Earlswood Nurseries, Redhill, was 2nd, with a very different group, in which foliage plants played a less prominent part. A number of plants was included of Madame Gustave Henry, a white incurved Japanese, elsewhere noticed as the recipient of a First class Certificats, Admiral Avellan, Souvenir de petits Amie Louise, and others, were well shown in the graup. The 3rd prize was taken by Mr. Geo. Stevens, Putney.

Twenty four Blooms, Jorganese.—The 1st prize was taken by Mr Jas. Agare norseryman, Havant. The flowers, whilst being commendable, were not so good as those shown at the similar show last season. Some of the best were Emily Silsbury, Duchess of York, Phebus, The Graphic, Duchess of Wellington, Pallanza, &c.

Twelve Blooms, Jopanese.—The 1st prize in this class was also taken by Mr. Jvs. Agare. His varieties were The Graphic, Madame Jos. Allamond, Mrs. Trafford, Phoebus, Wm. Seaward, Madame E. Rosette, Wilfred Marshall, Princess May, Le Chartrey, Emily Silsbury, Pallanza, and Mutual Friend. 2nd, Mr. Jas. Wa't, gr. to Henry Ben., Esq., Fi z-John Avenue, Hampstead. Varieties in this exhibit included Wm. Tricker, President Borel, Col. W. B. Smith, Duchess of York, Flame, and Sunflower.

Sir Blooms, Incurred .- Mr. JAS. AGATE was 1st, blooms of moderate quality, which lacked depth and build; the varieties were Mons. R. Bahnant, Perle Duphinour, a Japanese incurved bloom as shown, and Globe d'Or. 2nd, Mr. D. M. Hayler, gr. to W. Hannaford, Esq., J.P., Tenterden Hatl, Hendon.

The best two vases of Chrysanthemum blooms, to contain twelve blooms of large-flowering varieties in each, and any suitable foliage, &c., were from Mr. J. Tullett, gr. to G. ALENANDER, Esq., Warley Lodge, Brentwood, and they well deserved all communication; Mr. J. Brookes, gr. to W. J. Newman, Esq., Park House, Totteridge, was 2nd; and Mr. Jas. Agate 3rd.

Tredve Blooms Japaner (Amateurs).—Mr. MARTIN SILSBURY was 1st, with an exhibit that contained but one coloured variety, other than yellow or white. Snowdrift in the front 10w was a pretty seedling bloom with perfectly white, rather wide thorets, somewhat twisted. Other Seedling varieties were included, and there was a good bloom of Emily Silsbury; 2nd, Mr. W. Amies, South Ashford,

Six Blooms, Japanese (Amateurs).—1st, Mr. M. Sussuray, including four seedlings, and a bloom each of Emily Silsb ry and Sunflower.—2nd, Mr. W. Amtes.

In the Single-handed Gardener's Classes, a 2nd prize was

gained by Mr. J. Knapp, gr. to F. W. Ausden, Esq., 22, Chigamed by Mr. J. Khapp, gr. to F. W. AMSDEN, Esq., 22, Cul-chester Road, Croydon, for twelve blooms of Japanese dis-tinct; and the same exhibitor was lst for a collection of six blooms distinct, showing W. H. Lincoln, Mons. A. Molin, Madame E. Rey, Mrs. (W. H. Lees, M. C. Capitante, and Mille. Therese Rey.

Florel Accongenents (Open). - The best table of bouquets, Florel Accomponents (Open).—The uses acone or concepted, and other designs illustrating the value of Chrys uthennums for such purposes, was one from Mr. 1. Il Calcur, Fern Bink Nursery, Stoke Newington. The exhibit was a commendable one. Mr. W. Green, June, The Nurseries, Harold Wood, Essex, was 2nd; and Mr. Henry O. Garrono, with the contraction and Stoke Newington Station, 3rd

Mr. D. B. CRANT had an exquisite trio of Epergness arranged with Chrysanthemuns; and Mr. C. J. GATEROCSE, Granville Nursery, Lewisham, was 2nd.

The best wase of Chrysanthemums suitable for table decoration, was one from Mr. D. M. Hayler, gr. to W. Hannaford, Esq., Tenterden Hall, Henden.

Non-competative Exhibits.—That the floor of the building

was fairly well furnished with horticultural produce, it was due to the numerons and large exhibits made by the trade

Mr. W. J. Godfrey, Exmouth Nurscries, showed a number of blooms of Chrysanthennum Barbara Forbes, an October flowering white inemved Japanese variety, which was awarded a First-class Certificate in September. There were other varie-ties also, some of which were submitted to the Floral Committee. A number of Callas were shown also of the Little Gen

type, but with several distinctive names attached, the reason for which was not apparent.

Mr. JNO WATKINS, Pomona Farm, Hereford, and Messrs. WM. GAYMER & SONS, Norfolk, exhibited specimens of eider

and cider Apples
Mr. S. Mortmer, Farnbam, made an exhibit of various types of Dahlia blooms; and from Mr. Norman Davis, Fram field Nurseries, Sussex, was an extensive collection of perennial Asters in variety.

Mr. Thos. S. Ware showed a number of Chrysuthennum blooms, and one of the fountains was decorated around the

base by Dahlia blooms from the same firm.

Mr. Chas. Turker, Slough, showed a few Dahlias; and Mr. Chas. Shaw, florist. Sherwood, Nottingham, made an exhibit of Chrysanthemum blooms grown out-of-doors. Cannas were exhibited in a nice group of plants from Messrs. II. Cannell & Sons, Swanley; and Messrs Donne & Co., Rothesay, had out-of-doors grown Chrysanthemums, and a collection of Dahlia blooms.

Mr. H. J. Jones, Ryccroft Nursery, Lewisham, furnished a large table with sprays of Pelargonium bloom; and a few Chrysanthemums, and Dahlias and fruit were shown by

Messrs. J. Cheal & Sons, Crawley.

A pretty group of Crotons was the exhibit of Mr. T. W.

Davies, gr. to - DARNELL, Esq., Devonshire House, Stamford

Chrysanthemums in sprays from plants which had not been thinned, were shown by Mr. W. Piercy, 89, Beardwell Road, Forest Hill.

Messrs, Sankey & Son, Bulwell Pottery, Nottingham, had some of their well-known flower-pots; and samples of the One-and-All manures from the AGRICULTURAL AND HORTI-CULTURAL Association were noticed.

Mr. H. Berwick, Sidmonth Nurseries, exhibited fruit, as did also Messrs. Jno. Laing & Son, Forest Hill, S.E., and Messrs. Spooner & Sons, Hounslow.

Messrs. Webb & Sons, Stourbridge, had a collection of vegetables; and Mr. A. Lyeke, 14, Kensington High Street,

was responsible for a sparsely decorated dinner-table.

Messrs. Cuteush & Sons, Highgate, had a table of foliage plants, and a few plants in flower of Begonia Gloire de Lorrain :

The Floral Committee bad a considerable number, of subjects brought under its notice, though but few Chrysanthemnms were present, as it is a little too early for them to be shown in the best form. Surprise, a very fine large-flowered Japanese, large, full, and broad-petalled, the colour nowered dapanese, large, uni, and broad-petailed, the colour bright climson-amaranth, with a silvery reverse; and Madame Gustave Henry, a large, full, broad-petailed white both from Mr. W. Wells, Earlswood Nurseries, Redhill, both received First class Certificates of Merit.

Some varieties of a promising character, especially in the way of early-flowering decorative varieties, were shown by Mr. H. J. Jones and Mr. F. G. Foster, which will be seen in more natured character later on. Snowdrift, a highly promising white from Mr. MARTIN SILSBURY, was also much admired, and will, no doubt, receive a Certificate of Merit before long. The same may be said of Lady Grey, also a fine white Japanese, from Mr. R. OWEN.

In the way of Dahlias, First-class Certificates of Merit were awarded White Cactus Miss Webster, from Messrs. Dobbie & awareau winter Cactus Miss Webster, from Mrssss. Boble & Co., Rothesay and Orpington; and to the following Pompon varieties, from Mr. C. Turker, Slough, viz.:—Dagmar, Clarissa, and Gunivere. They also had some new Cactus varieties, that were searcely in sufficient character so late in the season to be at their best. Mr. Jarkoup, Stock, Devonport, Sent some of his pretty decorative varieties; and Mr. John Green, Derchun, his new Cactus variety, Aurora, also a little

out of character.

Messrs, J. Laino & Son, Stanstead Nurseries, Forest Hill, received an award for a fine early Apple, named Sir J. Banks,
From Mr. T. S. Warr came a distinct-coloured Nerine,

named Novelty, and a fine form of Sternbergia lutea, named macrantha. Several other subjects were staged, but the foregoing were the most noteworthy.

EXPERIMENTS WITH "JADU

THE following paper was read by the Secretary at the meeting of the Agri-Horticultural Society of India, held recently:-

"Jadu Fibre as a Propagating Medium," comparative experiments in propagation by "Gootee" or "China" layer, with the aid of "Jadu Fibre," and the ordinary kneaded clayey earth have been conducted since May 15 last with the following results: --

Variety.	Rooted in Jadu.	Rooted in Earth.		
Aglaia odorata		72 days	0 days	
Amberstia nobilis		43 ,,	67 ,,	
Bougainvillea lateritia		38 ,,	0 ,,	
Browneas		27 ,,	58 ,,	
Caesalpinia Grahami		0 ,,	0 ,,	
Cochlospermum Gossypium		0 ,,	0 ,,	
Filicium decipiens		65 ,,	0 ,,

			l	

From the above it will be seen that the Casalpinia Grahami and Cochlospermum Gossypium have not to date rooted; the branches of both of these on which experiments had been made died within two weeks of the operation being performed. In the case of branches treated in the ordinary way, as detailed below for the information of members to whom the operation is not familiar, it will be noticed that roots did not appear till nearly twenty days later than those treated with "Jadu." "0" indicates that these had not rooted to date of report, August 27.

"Gootee."-The following is the description of propagation by "Gootee," as it appeared in the Transactions of the Society, vol. iii., p. 2, and vol. vi., p. 18: -"Select a firm, healthy branch, the wood of which is well ripened, and immediately below a leaf-bud take off a small ring of bark, about I inch wide; scrape the woody part well, so that no bark remains. Apply a ball of well-tempered clay, bind it securely with tow, or other soft bandage, make it fast to a stake if necessary; hang a small pot having a hole in the bottom just over the Goetee, and supply it with water daily. In a few months you obtain a fine well-rooted plant As seen as the roots are seen protruding themselves through the bandage, the branch may be cut off from the parent tree, and planted where it is intended that it should remain. If it be found that the flow of water from the pot suspended above the 'Gootee' trickles too quickly, it is suggested that a thin piece of rope, knotted at one end, be passed into the pot and through the hole, the knot fitting the inside of the hole rather tightly; the other end of the rope should be drawn tight, and attached to the top of the 'Gootee.' In this way the water will trickle down the rope, and be distributed evenly over the 'Gootee.'

Hotherto Filicium decipiens has defied all methods of propagation, except in the way of cuttings on a hothed under glass; but a few good plants were secured by "Jadu" being used in the "Gootee" instead of earth or clay. Extract from "Calcutta Daily News."

SCIADOPITYS VERTICILLATA.

If one may give credit to rumour, this choice Conifer does not grow very freely in many places in the British isles, a matter of regret when we consider what a bandsome and distinct tree it is. I have about two dozen specimens under my care, which I have mostly grown from the seedling state; they are in perfect health, with dark green leaves, and make over 1 foot of growth annually. We find the best time for transplanting is from the middle to the end of October, and the soil they grow best in is loam, peat and leaf soil in equal parts. They require to be planted in a sheltered situation, as cutting cold winds very soon change their colour. Some plants which we put out in prominent but exposed sites, had to be removed to shelter again; they also require a certain amount of shade, and copious supplies of water during the summer months when growing freely.

If left to nature, I find the Sciadopitys will grow with a single leader and an open habit of growth, but if the leader be stopped when the plant is about I foot in height, it will send out lateral growths, and lay the foundation of a well-shaped tree, and later on will send up a leader. Recently, I measured a plant that had been stopped three years age, and is only seven years from the seedling state, and I find it is $5\frac{1}{2}$ feet in height, and $13\frac{1}{2}$ feet in circumference. Planter.

Obituary.

WILLIAM ROBINSON .- Many of our readers will learn with regret that Mr. William Robinson, headgardener for twenty years to Mrs. F. L. Ames, of Boston, U.S.A., died on Wednesday, September 16, at the age of forty-five years. Mr. Rebinson was a native of Bedale, Yorkshire, and was in early life employed in such good gardens as those of the Duke of Cleveland and Sir Titus Salt; and he was for some years employed in Messrs. J. Veitch & Sons' nursery, Chelsea. He was a good all-round gardener, and an expert cultivator of Orchids, and a hybridiser of them as well, and succeeded in raising some highly interesting crosses of Cypripediums, some of which are likely to remain extremely rare, owing to the scarcity of the parent species. He also tried his skill on Masdevallias, and several of his raising bave been distributed.

MRS. DARWIN.—The death is announced, at the age of 88, at Down, Kent, on the 2nd inst., of Mrs. Darwin, widow of the late Charles Darwin, the illustrious naturalist. Mrs. Darwin's maiden name was Emma Wedgwood, and she was the daughter of Darwin's nucle, Josiah Wedgwood, and the granddaughter of the founder of the Etruria works. She was married to Mr. Darwin on January 29, 1839. After their marriage they lived at 12. Upper Gower Street, where they remained until 1842, when the move to Down was male. It was at Down that Darwin died on April 19, 1882. A few days more and Mrs. Darwin might have lived to hear a Bishop at the Church Congress speak in wise and sympathetic terms of that hypothesis which another prelate some yaars since endeavoured to ridienle. But Bishop Wilberforce had not taken the measure of his Huxley!

WILLIAM PATERSON.—After a record of forty-years' faithful service as head gardener to Her Majesty the Queen, at Balmoral. Mr. William Paterson died on Monday of this week, at Daisy Cottage, Balmoral, at the age of 72. Mr. Paterson was a man of fine character, of the highest integrity, and of genuine Christian spirit, qualities that were appreciated by his Royal mistress and by the Royal Family.

William Paterson was born in 1824, at Mortlach, Banffshire, where his father rented a small farm. He received most of his education at the parish school of Fochabers, and, when 16 years of age, he was apprenticed to Mr. Christie, nurseryman, Fechabers, [in whose nursery in these days there was grown a good general steek. New shrubs were always added as they came out, and this gave William Paterson an excellent opportunity of acquiring a knowledge of their names, mode of propagation, &c., as well as the management of nursery stock, From Fochabers Mr. Paterson removed to Aberdeen, where he entered the then celebrated nurseries of Messrs. Roy & Sons, and he remained there for two years, acquiring a still wider knowledge of his profession. Thence he entered the service of the Duke of Leeds at Old Mar Lodge, Braemar (a few miles above Balmoral Castle), where he remained two seasons. In 1847, on the recommendation of Mrs. Farquharson, of Invercauld, Mr. Paterson was appointed head gardener to Sir Robert Gordon, at the old castle of Balmoral, which occupied a site not far from the present stately pile. Bulmoral was at that time leased by Sir Robert from the then Earl of Fife. Only three days after Mr. Paterson's appointment Sir Robert died, and Her Majesty the Queen then took over the remainder of the lease. on the expiry of which she purchased the Balmoral estate. It was at Martinmas, 1847, that Mr. Paterson went to Balmoral, and in August of the following year he was formally appointed to the position from which he only refired in 1592, in consequence of declining health. A pension was granted him by Her Majesty, who also placed the beautiful Daisy Cottage at his disposal, where with his wife, who survives him, he spent the concluding years of his life, enjeying every comfort. Five years ago Mr. Paterson underwent an operation at the hands of Professor Ogston, of Aberdeen University, which was successfully performed, and prolonged his life, although latterly he suffered a good deal of pain. If anything could have alleviated those sufferings, it would have been the constant solicitude for his comfort shown by Her Majesty the Queen, Princess Henry of Battenberg, and other members of the Royal Family. During his last illness he was attended twice a day by Sir James Reid, Her Majesty's private medical man. Mr. Paterson had a thorough knowledge of his profession. He was not only a successful florist, but he had a wide and accurate knowledge of shrubs and trees, and he was possessed of excellent taste. Few could with more skill produce a bouquet or decorate a table.

Mr. Paterson leaves a widow, one son and three daughters. The son is Lieutenant Paterson, 1st Vol. But. Gordon Highlanders, Aberdeen, one of the best-known shots in Scotland. The funeral took place on Thursday, the 9th inst., at Crathic Churchy and Balmoral.

ALEXANDER SIMPSON SMITH, GARDENER AND NATURALIST. -The death, at the age of 59 years, is announced of Mr. Alexander Simpson Smith. head gardener at Castletown, in which capacity he had served the family for nearly thirty-five years. Mr. Smith came originally from Aberdeen, where he and a younger brother, who at the present time is head gardener to Lord Rosebery at Mentmere, served their apprenticeship, and afterwards became distinguished members of their craft. Mr. Smith's quiet and unobtrusive manners endeared him to all with whom he came in contact. He took a lively interest in every social movement affecting the good of the district in which he so long resided, and in which the influence or his gentle life will not soon be forgotten. Mr. Smith leaves a widow, three sons and one daughter. His remains were interred in the Castletown family burial ground in Rockliffe Churchyard. Mr. Smith was a born naturalist as well as a most enthusiastic sportsman. His interest in zoology was not limited to ornithology. He observed wild life too lovingly to limit his interest to any one section of natural history Many naturalists residing in other parts of England have enjoyed the rare privilege of being introduced to the bird-life on the Solway Marshes by Mr. Smith. He was at all times very ready to supply information about local natural history when the Birds of Cumberland was in preparation. Mr. Smith was also a regular contributor and subscriber to the British Rainfall, edited by Mr. G. J. Symons, F.M.S., several copies of the annual record having been presented to Tullie House by Mr. Smith.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr, for the period named; and this combined result is expressed in Daydegrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.

THE PAST WEEK.

The following summary record of the weather throughout he British Islands for the week ending October 3, is

"The weather during this period showed a considerable improvement over the kingdom as a whole, but a good deal of rain was again experienced in the western districts.

"The temperature differed very little from the mean. The highest of the maxima, which were recorded on September 27.

highest of the maxima, which were recorded on September 27 over England, and later in the week over Ireland and Scotland, ranged from 69 in the 'Channel Islands,' and 67' or 68' in most of the English districts, to 63' in 'Scotland, N.,' and 61' in 'Scotland, W.' The lowest of the minima were registered about the middle of the week, and ranged from 34' in 'Scotland, N and E ,' and 35' in 'England, E.,' to 41' in 'England, S.,' and to 45' in the 'Channel Islands' "The raafall somewhat exceeded the mean over Ireland and in 'Scotland, N.,' and just equalled it in 'England, S.W and N.W.;' in all the other districts, however, the fall was considerably less than the normal.

was considerably less than the normal.

"The bright sunshane slightly exceeded the mean in 'England, N.E.,' and just equalled it in 'Scotland, E.,' but was deficient in all other parts of the kingdom. The percentage of the possible amount of duration ranged from 33 to 28 in most of the English districts, to 21 in 'Scotland, W.' and 'England, N.W.,' 16 in 'Scotland, N.,' and 15 in 'Ireland, N.''

ENQUIRIES.

"He that questioneth much shall learn much."-BACON.

ECZEMA CAUSED BY ROMAN HYACINTH.-It would appear in some instances that a form of eczema has been caused by handling bulbs of the common Roman Hyacinth, or possibly by the Buckwheat-packing in which they are received in this country, large dealer in these bulbs noticed anything of the kind this year? Hyacinthus.

Screen of Ferns, —A correspondent, "H. T. M.," writes: "I have for several years derived much pleasure in collecting specimen fronds of exotic Ferns, which I have pressed, and am now keeping in a large folio, my intention being to form a collection in the way of a screen of four folds, but am at a loss to know how to proceed in placing the fronds on to the screen which has a smooth white surface, also what adhesive to use for the purpose. Will any reader of the Garto use for the purpose. Will any reader of the Gardeners' Chronicle, who has had experience in such, kindly advise me."

MARKETS.

COVENT GARDEN, OCTOBER 8.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Explanation of the prices are present to the control of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Explanation of the samples are present the samples of the sample

BRACHYCHITON ACERIFOLIUM. - We note in Garden and Forest for September 23, an allusion by Mr. E. Sturtevant to this plant, which, he says, does well out-of-doors in the southern part of California. A tree is mentioned which is 25 feet in height, and of fine pyramidal shape. At the time of flowering it is destitute of foliage, but is literally covered with blossoms, which are in colour bright vermilion, and in shape resemble those of Lily of the Valley. This should make a good plant for our warm

conservatories and greenhouses. At present it is only seen in Botanic Gardens. We may assume that pot culture, as in the case of the tree-like Acacias of Australia, would dwarf the growth of the plant to convenient dimensions without spoiling its floriferousness. This species is now placed under Sterenlia, vide Index Kewensis.

BOOKS: II. S. P., Leytonstone, Fruit Farming for Profit, by G. Bunyard, 3rd edition, published by F. Bunyard, 29, Week St., Maidstone; or a similar F. Bunyard, 29, Week St., Maidstone; or a similar one brought out recently by J. Cheal, Lowood Nursery, Crawley.—Market Gardening, Husbandry, by A. Roland, sold by D. W. Morgan, The Abbey Library, Little College Street, Westminster, S.W.—Kitchen and Market Gardening, by Shaw, published by Maemillan & Co., London. This contains a list of tools, and figures of the same, that you require. -Unery. Carnation Culture for Amateurs, by B. C. Ravenscroft (published by L. Upcott Gill, 170, Strand, W.C.

CANADA: F. B. Certain seeds can be harvested in a very fine condition in Canada, especially some kinds of grasses, I'eas, and Clovers; but as regards perennial (herbaceous?) plants, it would not do to venture on growing any but those which are capable of withstanding a very low temperature. other inquiry should rather be addressed to the editor of the Canadian Horticulturist, Ottawa.

onifers for Chalk Solls: Junior. Abies amabilis, cephalonica, Douglasii, grandis, magnifica, nobilis, Nordmanniana, Pinsapo, and Webbiana. Picea Alcockiana, excelsa, Morinda, nigra, and clanbrasiliana. Pinus Cembra, excelsa, halepensis, Lambertiana, Laricio, Pallasiana, Pinaster, ponderosa, Strobus, austriaca, and sylvestris.

CYMBIDION LOWIANUM: T. F. To have flowers on a plant of Cymbidium Lowianum in September shows that the cultivation has been at fault. The plant should be showing the flower-spikes in January or February, and during the resting period preceeding its flowering the compost should be kept slightly moist, never dry. Your note affords no particulars as to culture.

FIGUS ELASTICA: C. R. M. Place the plant in heat of 60° to 70°, so as to induce growth; and in January or February take the tips with some mature wood at the base, and as much of the one and two-year-old wood as you can obtain from the plant, making this into lengths of three to four nodes, and inserting them not deeper than threequarters of an inch into a bed of sand, or sand and loam, on a bottom-heat of 80° to 85°. Keep close, and afford air when there is excess of moisture.

FRUITING OF STEPHANOTIS FLORIBUNDA: J. A. B. Not uncommon in warm years.

FRUITS AND CLAY SOIL: Pomo. Apples and Pears as bushes or espatiers would be suitable, if the land be properly drained, and as you have forty varieties of these fruits worked on dwarfing stocks, they would come early into bearing, and endure in good condition for ten to fifteen years. Being in Sussex, your Pears, whatever the varieties, should ripen out in the open quarter. If you decide to plant standards on free stocks, any variety of Apple should succeed, excepting perhaps the Calville's, Court Pendu-Plat, and a few others. Some selection would be advisable in regard to Pears, refraining from planting those which ripen late or scarcely at all in this country. Most early and mid-season varieties will do well, also Marie Louise d'Ucele, Chanmontel, Knight's Monarch, Glou Morçeau; the stewing varieties, as Verulam, Vicar of Winkfield, and Catillac; Brown Benrré, General Todtlebon, that delicious small Pear Aston Town, Benrré d'Aremberg, &c.

Gardeners in New Zealand, &c.: E. R. The prospects of a gentleman's gardener are, we believe, not of the rosiest description in this colony, and we would not advise you to go there with an idea of meeting with remunerative employment in such a capacity. The climate is temperate and insular in character. Victoria would serve your purpose better.

"GARDENING APPOINTMENTS": A. L. We make no charge for inserting these announcements.

HOLLIES: Young Gardener. These may be removed and planted in a manner similar to that described for Laburnums; but the removal should not be undertaken till the month of April, or later.

LATE GROWTH ON CATTLEYA: Pomo. There is no better course than to let them grow till of full size, and then rest the plants,

LILY-OF-THE-VALLEY PRIZE: Convallaria. We are of the opinion—and it would be generally so decided in this country in case of similar dispute—that as the schedule contained no condition in regard to the time the plants should be grown in the pots, the prize was rightly given to the best pots of Lily-of-the-Valley, notwithstanding the circumstance that they were filled with dormant (dry) erowns.

MARGUERITE CARNATIONS: Pomo. As the plant flowers six months after sowing the seeds, and good strains produce a large percentage of double flowers in varied colours, there seems to be little gained by propagating it by enttings or layers. It is now too late for layering, unless you could manage it in

pots under glass.

Po's anger gass.

* The application to name flowers, and especially fruits, are so numerous at this season, as severely to tax our resources. They entail an expenditure of time, labour, and money, of which our readers have little idea. We are most desirous to oblige our cirrespondents as far as we can, but we must request that they will observe the rule that not more than six varieties be sent at any one time. The specimens should be good over, put upper aching expenses, and to prevent disappointment, they should be properly numbered, and curefully packet. We do not undertake to send answers through the post. Delay in any exercism enables.

Names of Fruits: W. D. H. Pear, Bergamotte d'Esperen.—J. F. Emperor Alexander.—Tweed.
1, Yorkshire Greoning; 2, Hawthornden; 3,
Grange's Pearmain; 4, Cox's Pomona; 5, Blenheim Orange; 6, Golden Noble.—G. A. 1, Beurré Clairgeau; 2, Williams' Victoria; 3, Welbeck Bergamotte; 4, Duchesse d'Angoulème; 5, Pitmaston Ducbess; 6, Brown Beurré.—J. W. 1, Mother; 2, Cellini; 3, Josephine de Malines; 4, Soldat d'Esperen; 5, Althorp Crassane; 6, Conrt of Wick; 7, Duke of Devonshire.—F. Bennet. Apples, 1, Alfriston; 2, Loudon, Syn. Five Crowned Pippin; 3, Claygate Pearmain. Pears, 1, Sonvenir du Con-3, Claygate Pearmain. Pears, I, Sonvenir du Con-3, Claygate Pearmain. Pears, 1, Souvenir du Congrès; 2, Soldat d'Espereu.—S. B. 1, Old Crassane; 2, Autumn Bergamotte; 3, Brown Beurré: 4, Benré Diel; 6, Blenheim Orange; 7, Plum Reine Claude de Bavay.—Il'oudyate. 6, Pitmaston Duchess; 2, smashed; 3, Beurré d'Aremberg; 8, Marie Lonise; 14, Doyenné du Comice; 16, White Doyenné.—J. R. G. 1, Worcester Pearmain; 2, Winter, or Old Pearmain; 3, Lane's Prince Albert: 5, Twin Cluster Golden Pippin; 4, Mère de Ménage—L. F. P. 1, Dumelow's Seedling; 2, Dumelow's Seedling: 3 not known: 4, Sturmer Pippin: 6 Seedling: 3, not known: 4, Sturmer Pippin: 6, not known: 7, Beauty of Kent. Pear, badly brnised, probably Marie Louise.—K. H. Apple, Old Monarch.—We acknowledge the receipt of 1s. in stamps from J. P. D. for the funds of the Royal Gardeners' Orphan Fund.—Amateur. 1, Striped Beefing: 2, Winter Strawberry; 3, not known: 4, Blenheim Orange; 5, poor specimeus of Louise Bonne of Jersey; 6, Beurré d'Amanlis.

Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number. — G. Bartle. 1, Ophiopogon Jaburan; 2. Ailanthus glandulosa, probably; 3, Spirae Aruneus, so far as we can tell in the absence of flowers; 4, Purple-leaved Hazel; 5, Abies Pinsapo: 6, Calycanthus floridus, probably: 7, Hibiscus syriacus var. — all of them very wretched specimens.—J. G. Shinfield. We cannot undertake to name florists' varieties of flowers .- J. T., Epsom. Pterocarya fraxinifolia [cancasica]: fruits next week.—J. W. B. Cattleya Eldorado.—E. M., Durset. The single Dahlias are very pretty, and well worth increasing.—H. K., Farleigh. Alonsoa linifolia.—M. A. 1, Thnya orientalis var. japonica; 3, Cupressus Nootkensis: 4, Ruscus hypophyllum; 5, Cupressus funebris.—C. G. 1, Koelreuteria paniculata: 2, Borago officinalis.—F. F. 1, Aster bessarabicus: 2, Enothera Fraseri: 3, Helianthus multiflorns, flore-pleno; 4, Coronilla Emerus.-R. T. Ligustrum Incidum.—G. R. 1, Siberian Crab; 2, A Crab not recognised; 3, Staphylea pinnata; 4, Clethra alnifolia. Send alpines when in bloom, and when in fruit if possible—F. B. The yellow flower is Sternbergia Intea, the other Colchicum autumnale variety.

PLAGUE OF COCKROACHES.—Replying to "L," a correspondent recommends Penny, Hester & Co.'s Magic Paste; it is sold at 26, Mayfield Road, Dalston, N.E.

Scots Fire: Lymington. The injury to the tips of the shoots is occasioned by the Pine-beetle, Hylurgus piniperda. You cannot do anything to arrest the mischief beyond clearing away and burning all rubbish in the wood, which forms hybernating quarters, for the insect.

SEEDLING APPLES: IV. Thompson. Fruits large, very highly coloured, and beautiful, but of poor quality ; greatly inferior to others in cultivation.

SLUG DESCENDING BY MEANS OF A THREAD: J. Cowan. This was the occasion of considerable correspondence in the last volume of the Gardeners' Chronicle for 1895, pp. 160, 190, 216, and 245. The slug, a small species, probably came into the house with the imported Orchids.

TRANSPLANTING AGED LABURNUM TREES: Young Gardener. If you are careful to extract as many of the roots as possible, and to keep them moist after they are dug out of the soil, and spread them out over a broad beehive-shaped mound raised in the hottom of a hole that is rather more in diameter than the root mass, the job being performed at the present season, the trees should not fail to succeed. The other essential points are the pruning away of all badly-damaged roots, and to mutilate them as little as possible. In the work of digging out, to go down deeply and get out some or all of the tap roots, i.e., those which descend perpendicularly into the soil, to reduce the size of the crown, and to secure the trees when planted either with guying wires seenred to stout stumps driven deep into the soil, or with three 7 feet-high-stakes placed round the trees at a distance of 11 feet from the stems, for nuless the rocking of the trees by the wind be prevented, their re-establishment will extend over several years, or it may not take place at all. Before planting. the soil should be well trenched and manured, and well consolidated by trampling it both during and after planting. There is another way of removing the trees, viz., by excavating them with solid balls of soil and roots 5 feet to 6 feet in diameter; all roots outside this mass being carefully dug ont entire, or as nearly so as possible, enveloping them in wet grass, &c., and fastening them down to the top of the ball with wooden pegs. To move such masses of soil involves the use of a transplanting machine, or of massively made trolleys, and several

Tree Ferns. If the person for whom we inserted a notice concerning Tree Ferns in the Gurdeners' Chroniele, will kindly famish us with his address, we will forward to him several letters we have recently received.

VINE ROOTS: R. D. L. We are of opinion that Phylloxera is present on the Vine-roots. The appear ances favour such an opinion, and on careful examination we find a very young individual of what can searcely be other than the insect itself. If you wish for further proof you will probably obtain it by taking up a piece of a larger root than those sent, shaking off the earth, and examining erevices or depressions, where the insects will be found congregating in little masses. R. McL.

AND SIMPENCE FOR EVERY ADDITIONAL LINE. If set across two Columns, the lowest charge will be 20s If set across three Columns the Iowest charge will be 30s. Page, £8; Half Page, £4 10s.; Column, £3.

Advertisements guaranteed to appear on the front page are charged at the rate of 1s. per live, head line counting as two lines. No display is allowed.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Position.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS.—In many instances
Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting

to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to II. G. Cove, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, Wellington Street, Strand, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. G. COVE.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with

complaint).

NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, consequent on the large increase in the circulation, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

PELARGONIUMS and CHRYSANTHE-MUMS.—Just now our display of these is said to be much the best we have ever had. We should feel a real pleasure in showing all interested: our many seedlings of both that we have been working for so many years to attain perfection, are a great move onwards. To all those not able to journey, a Catalogue shall be sent, post free.

H. CANNELL AND SONS, Swanley, Keat.

Friday Next, October 23.

SALE of RARE and SPLENDID TYPE3 of CATTLRYAS, obtained from the Southern Slep's of the SANTAYUNI DISTRICT. This Cattley agign, Sanderne section, mixed with C, aurea chrystotoxa, is the non-plu-ultra of all that is finest in the Cattleya family, and believed to be an even finer type than those previously obtained from Santayuni, The plants were gathered on a small mountain range, and our man saw in bloom this grand type of aurea, the finet he has yet seen, growing with Cattleya gigas Sandera. It was from the Santayuni district we orig ually imported the regal Cattleya Oweniana, the rich purple Rothschildiana, and the marvel'ous white-sepalled and petalled aurea. Mrs. Fred Hardy.

GRAND FNHIBITION CATTLEYAS, a Short-bulbed Montana Type of Mendelli, from Losanos Nevada, with spikes of a doz-ol large flowers, which we think points to Cattleya Sanderiana being mixed among them. We guarantee them from a district previously uncearched for Orchids. They are most remarkable in appearance, with thicker and larger spikes than any other Mendeli, C. Sanderiana, and natural hybri's between the two. Owing to the great length of the journey, and the many mishaps which befel them, the plants are not so fresh as we should wish, but the eyes are firm and quiet dorm-int, and we have an heatation in saying they will plump up and do well. We commend this caportunity most strongly, for the great cost, and what must always remain a loss will prevent us ever again sending to this district.

ANOTHER PROPERTY.

ORCHIDS FROM MADACASCAD

ANOTHER PROPERTY. ORCHIDS FROM MADAGASCAR.

For absolute Sale. Some remarkable kinds are among them. They represent the remains of a hig lot of plants collected by a French military expert, who travelled un Madaguscar, lately deceared, and are sold on secount of his widow and children. Among them are round-bulbed

BULBOPHYLLUMS, MEGACLINUMS, ARACRANTHES (?), PHAIUS, in wav of Henryli, in graud order.
.ERANTHUS ZYGOPETALOIDES (?), remsrkable-looking

Gardeners' Othronicle.

SATURDAY, OCTOBER 17, 1896.

THE CHAMPS ELYSEES.

THE recent visit of the Czar to Paris has been of some interest from the gardener's point of view, not only as affording an instance of the importance of trees in the embellishment of city streets in general, but more particularly because of the discussion which has taken place in this connection on this particular occasion.

The elaborate preparations made by the Parisians to decorate their beautiful city did not receive unanimous approval in France, even among the most ardent supporters of the Franco-Russian entente. It was not that objection was taken to the vast amount of money spent, but rather to the way in which it was spent, to the flimsy methods which were adopted in many cases, and to the inartistic effect thereby produced.

More especially was the protest made in connection with the "decoration" of the Champs Elysées, where the recent memorable cyclone and the subsequent equinoctial gales played havoe among the trees. If the beautiful avenue is really magnificent, as is indeed generally admitted, then, said the critics, it was unnecessary to suspend garlands of variegated paper rosettes to the trees, in order to atone for the prematurely - fallen leaves. More than one influential journal appealed to the authorities to prevent the perpetration of the outrage, as it was called, however natural it might appear to the theatrical decorators who had been employed to decorate the line of route. And when, at the last moment, it became apparent that the good counsels would not prevail, the Journal des Delaits cynically suggested that, as birds are searce in the Champs Elysées, the addition of, say, a hundred thousand mechanical songsters among the trees would not only attract more attention to the paper flowers, but would show their absurdity, and serve, moreover, as an object-lesson for future occasions, by teaching that trees may be beautiful even in the autumn, but that they may be disfigured very easily indeed.

It may be of interest in this connection to give a short historical account of the Champs Elysees, which now contain more than 5000 trees. At the beginning of the seventeenth century the site which the promenade now occupies was still land in cultivation, with isolated houses and small gardens attached. In 1616, the Queen Regent, Marie de Médicis, purchased a portion of this land, which bordered on the river, and planted a long private walk known as the Cours de la Revne Mere. which subsequently, and until the French

Revolution, became a favourite resort of the

The celebrated landscape gardener, Le Nôtre, afterwards designed the adjacent Grand Cours, which, towards the end of the reign of Louis XIV., received its present name of Champs Elysées. The avenue was lengthened by the architect Gabriel in 1764, and the ownership passed from the Crown to the State in 1792. On condition of further improvement, it was ceded to the city of Paris by a law of 1898.

The law's delay was a truism also in Franco at that period, and it was not until 1835 that the Municipal Council of Paris appointed a commission to report upon the subject, or until 1841 that any steps for further amelioration were taken. Not, indeed, that none were necessary, because the Champs Elysées were described in 1836 as almost impassable by day on account of the bad state of the roads, and by night by reason of the hosts of vagabonds who frequented them. It would, however, be tedions to refer to the work which, since that date, has produced the promenade of which Parisians are so justly proud.

As regards the various buildings which have at various times been built in the Champs Elysées, it may be mentioned that the first concessions for this purpose were given in the reign of Louis Philippe for the erection of various cafés and pavilions. During the Second Empire several structures were added, including the Palais de l'Industrie, which, in 1852, was leased to the State by the municipal council at a yearly rental of £60. The rent was raised in 1890 to no less than £1000; and the total revenue received by the city of Paris for the various buildings in the Champs Elysées amounted to nearly £11,000 in 1895,

NEW OR NOTEWORTHY PLANTS.

GONGORA SANDERIANA, Krzl., n. sp.*

AT first sight, I assumed that I had to deal merely with a variety of Gongora portentosa, Rehb. and Linden, but an examination of the plant showed so many differences, that I resolved to establish a new species. The pseuso-bulbs are nearly 5 inches high, and towards the base 13 inch broad, the leaves are broader, the racemes fewer flowered, five or six in most specimens; and they are provided with pedicels of the unusual length of 4 inches. The side-sepals are as broad as long the odd sepal broadly ovate; the petals and the column have the same shape as those of G. portentosa, but the lip is somewha different. The mesochile, viz., the principal part of the lip, is low from the base to the middle; elevated from the middle to the end, and forms two square-shaped side-lobes, with the two characteristic bristles on the posterior edges, whilst in Gongora portentosa the side-lobes occupy the whole length of the mesochile, ending in two prominent teeth. The bristles are placed at the anterior edges; the lip when seen from the side is much higher in

Gongwa Sanderium, Krzl., u sp. Allinis Gong portentose Rehb, f. Bulbis magnis anguste conoideis obtusis 10–12 cm. altis, basi 4 cm. diam; foliis periolatis late oblongis (exel. pedamento) circa 25 cm. longos, 11 cm. latis quinquenerviis. La cmo longo pendulo, 30 cm. excedente parciflaro; bracteis minutis triangulis, ovariis cum pedicells 8–9 cm. longis, sepulo dorsali late ovato acuto, lateralibus majoribus latissime ovatis (aprillongis ac latis), acuto ambez pone apacan simutis; pedals crassis exmosis linearibus antice axistates; labelli pede descendente Helli hypochillo rectangule affixo lineari, mesochilio angusto infra octilineo margimous implicatis contiguis, lobulis lateralibus errectis quadratis angulo posteriore (basin versus) in circos quis longiores apice circimatos productis, rima inter lobulos angusta tuberculo crasso postice (basin versus) ac ito huic rime anteposito apica mesochilii acutato in epichilium lineare semilonomi tenuissimum angustato. Plores illos 6, leportentos e Rehb f. et Linden, magnitudine superant robor G galente typicae. Iptroduxit F Sandar, Vernschensis T. Kom lon.

G. portentosa than in the new species. The colour of G. portentosa, figured in the Bot. Mag., t. 6284, is white, or partly flesh-coloured, finely spotted with more or less intense purplish colour; whereas the colour of G. Sanderiana is darker, yellowish or brownish, with numerous rose-coloured spots, especially on the whitish-yellow petals and colourn. The flowers when fading have the peculiar perfume of fading flowers of Stanhopea. The characters I pointed out show a plant very near to G. portentosa, but as the peculiarities of the lip are of the highest systematical value, we must admit a new species. The plant was imported from Peru by Messrs. F. Sander & Co., St. Albans, and flowered for the first time in August. F. K.

TRICHOPILIA COCCINEA.

By the kindness of Sir Trevor Lawrence, Bart, we are enabled to give an illustration of a very fine specimen of Trichopilia coccinea which he saw in the

of this rarity is as follows:—In *The Garden*, of Angust 21, 1886, is a note mentioning that there are seedlings of Odentoglossum in Mr. Buchan's collection at Southampton. At the sale of the collection, General Berkeley, of Southampton, purchased the seedlings that had grown fairly strong. In 1893 the first plant bloomed. It appeared at first sight to be a white-lipped O. Uro-Skinneri. The Orchid Committee gave it the A.M. under that name. There was diversity of opinion, but it was hoped that, given further time and more plants, blooming would prove it.

In 1895, Mr. E. Ashworth bought the remainder of this plant, as well as the other seedlings of the same batch. I have just had Mr. Ashworth's letter, saying none of his plants will bloom this season, much to my disappointment, for I hoped that 1896, being its tenth year, would settle the matter; but my plant is the only piece out of the batch that has as yet bloomed. Referring to the correspondence I have, commencing with the late Mr. Buchan in August, 1886, I find that his gardener, Mr. Osborne, does not

FIG. 77.-TRICHOPILIA COCCINEA: GROWN BY HERR OTTO FREBEL, ZURICH.

gardens of Mr. Otto Frobel at Zurich, and a photograph of which he obtained, and forwarded to us remarking: "It is one of the finest examples of successful cultivation I have ever seen,"

Probably, since its first introduction from Central America, where Warscewicz discovered it in 1819, no plant of equal beauty to this has flowered in gardens; and such a display of carmine-crimson flowers among the bright green pseudo-bulbs and foliage must form a charming picture, some idea of which a glance at our illustration (fig. 77) will give.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM URO-SKINNERI ALBUM.

This plant passed into my collection on Oct. 10, 1893,* and is now again in bloom for the second time; the 1893 spike was its first appearance. The history

remember if he crossed the Uro-Skinneri flowers. or whether it was merely self-fertilised. This is unfortunate, as there is but the plant to prove the second parent, and to those who are familiar with Orchid hybrids, this is barely enough, for in many eases it is very hard to see which the parents were With the plant now before me, as well as O. Uro-Skinneri (its known mother), and O. Bictoniense, it is hard to prove, but easy to believe that O. Rossii had a "hand in the deal," or perhaps O. Humeanum on account of the yellow sepals and petals. But the crest of the lip excludes O. Rossii in toto, for it is that of true Uro-Skinneri. The form as well as the eolour of the lip say "Rossii" plainly enough; so here are two "points" in the chief segment of the bloom in direct opposition to each other. So the lip, barring its colour, is like that of "Uro-Skinneri." Now we come to a pure yellow column with form and wings like its mother. Where does the rosy colour go to, and where does the yellow come from under the influence of self-fertilisation? So what is the column ! Now the petals ? These are narrower than in O. Uro-Skinneri: they are yellow, faintly dotted all over with a darker shade. How is

^{*} The references to this plant are in Orchal Review of Nov., 1803, p. 334; Sept. 1805, p. 259; Oct., 1805, p. 290, and the various horticultural papers following on Oct. 19, 1803, when part of the plant was awarded an A.M. by the Royal Hoeti cultural Society

the banding and aggregation of brown of O. Uro-Skinneri's petals turned into yellow dots all over the pctal? The sepals follow the same lines as the petals, except the depth of the keel or their backs. The spike has O. Uro-Skinneri habit on a much smaller scale, opening one or two blooms at a time, but the bracts and buds are different. Finally, the plant—its leaves and bulhs are smaller and more delicate than those of O. Uro-Skinneri, hence, the evidence is here for Rossii parentage, the leaf joins the bulb rather peculiarly, and tho bulbs are more elongated and less spotted than O.Uro-Skinneri. Which was the father? Dr. B. Crow hay.

individual flowers spring. It is growing and flowering in an ordinary conservatory, and a plant very greatly prized by its owner.

MILTONIA CLOWEST GRANDIFLORA.

A specimen plant of this useful species is growing in Mr. Hinchliffe's conservatory. The plant is bearing twelve racemes of flowers, each consisting of about twelve flowers of large size, much larger and brighter indeed than in the normal form. The dorsal sepal of the species stands erect, while the two interior ones are retrorse, and as it were, bug the flower foot-stalk; the petals emerge at right angles,

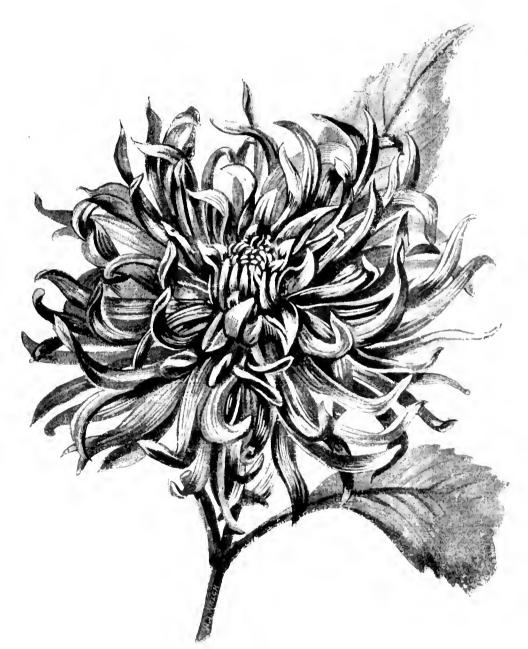

FIG. 78 .- CACTUS DAHLIA "FANTASY."

CYPRIPEDIUM CHAMBERLAINIANUM.

In the collection of Sam Hinebliffe, Esq., Ashfield Hall, Cheshire, is a superior variety of Cypripedium Chamberlainianum. Like most other imported species, the flower of this species differs greatly in form, colour, and size. The one in question is very robust, and has a peduncle which has reached 2 feet from the base, has been more or less in flower for two years, and shows that it has produced twenty flowers during that period. It is strikingly distinct from all other species in the curiously formed, large walled-in greenish bracts, which impart a grotesque appearance, from which the

and then converge towards the dorsal sepal, forming an insect-looking outline. The Indian-red blotches on a yellowish-cinnamon ground, are common to the whole of the segments. The lip is large and panduriform, the blade whitish, the bridge a dull purplish-red with yellow-ridged calli, a good lasting flower, and an exceedingly effective one for specimen purposes. An intermediate temperature seems best suited for it. J.A.

CATTLEYA WARSCEWICZH "COUNTESS OF DEBBY."

This remarkable variety of Cattleya Warseewiczii is again in flower in the collection of Thomas Statter, Esq. (gr., Mr. R. Johnson), Stand Hall, Whitefield,

being its third year of flowering, and the flowers are of finer quality than those of previous years. It was exhibited in 1894, and received a First-class Certificate from the Royal Horticultural Society. Unlike all other C. gigas, its segments are pure white without, and the form of the flower is exceptionally good. The beautiful crimson colour on the blade of the all but circular lip is very striking, the more so because of the purity of the white segments, and the edging is of cerise. On the blade of the lip are two large orange blotches, and then a blending of crimson, with pale erange lines run up the tube to the base of the column. The outer portion of the convolute half of the labellum is heavily marked with shaded crimson, but the albino segments puzzle one as to whether it is a natural hybrid, Warscewiczii and aurea, or a spontaneous evolution from an uncrossed Warscewiczii capsule. The plant is growing well in one of those tapering cylindrical teak baskets that are in common use at Stand Hall; and Mr. Johnson says that it may be regarded as a good grower. J. J.

CACTUS DAHLIA "FANTASY."

OF the numerous varieties that have been obtained in this section of Dahlias since the type originated in D. Juarczi, one of the most distinct, and one of the most quaint in appearance, is the variety under notice. "Fantasy" was exhibited at the National Dahlia Society's Exhibition at the Crystal Palace by Messrs, J. Burrell & Co., Cambridge, when a Certificate of Merit was awarded it, although doubts were expressed as to the flower-stems being so long as desirable. On Sept. 5 there were two dozen blooms of the variety exhibited before the Royal Horticultural Society at the Drill Hall, with stems as long and as stout as could be wished, and the Floral Committee recommended an Award of Merit. As will be seen from fig. 78, many of the florets are much incurved, others are twisted, and the general appearance of the flower is crab-claw-like. The colour is bright red, and very showy.

THE ROSARY.

NAMES OF ROSES.

While handling some of the newer Roses a day or two back, I was more than usually struck with the close similarity, the repetition, and the seemingly foolish length of many names. It is difficult for many amateurs to be certain of what Rose they are speaking, when we find no fewer than three distinct varieties under the same cognomen. As an example, let us take Madame Victor Verdier, a favourite dark Rose; this was sent out in 1864 by E. Verdier, who also introduced another H. Perpetual in 1884 under the name of Souvenir de Madame Victor Verdier ; while, previous to this, we had Souvenir de Victor Verdier from the same firm, and Victor Verdier from M. Lacharme. We have by no means exhausted the Verdiers, for I find Eugenie Verdier (H.P.), Eugene Verdier (Moss), and Eugene (another H.P.), also Madame Engène Verdier sent out by Guillot Senior, 1859; in both the H. Perpetnal and Tea scented classes the latter issue of Gloire de Dijon, sent out by Ant. Levet in 1882. In fact there are a couple of Roses in the H. Perpetuals named Mademoiselle Engénie Verdier, a seeding of Guillet Junior, 1869; and this season we have Souvenir de Madame Engévie Verdier among the newer H. Perpetuals. Such minor cases as Charles Verdier (H.P.), and Madame Charles Verdier (H.P.), Lacharme, 1864, we might leave with Emilie Verdier, Paul Verdier, Marie Verdier, and others, were it not that we now have Souvenir de Charles Verdier in addition. But I think enough has already been noted to show how very confusing Roses under the name of this family have become.

It is almost as bad with the varieties named after the Orleans family, for we have no fewer than fourteen ending with this word. Many of them are not so short and simple as Duc d'Orleans, but give full names of princes and princesses. Here we also have Princesse Marguerite d'Orleans, both in the hybrid perpetuals and Teas. Albert la Blotais appears twice in the H.P. class; Anna de Besobrasoff, twice; Comte de Paris, among both Teas and H.P.'s; we have Victor Hugo and Souvenir de V. Hugo in the H.P.'s, also the latter among Teas. The confusion caused by Roses being named in remembrance of one who has already been honoured with a representative name in the list is increasing very rapidly. Another example from the Dukes and Duchesses may be given. We have Duke of Edinburgh in the H.P.'s, and the Duchess in two classes; Duke of Connaught

appears among H.P.'s, and among the H. Teas, the Duchess also appearing in both classes. If a person orders or speaks of Rose Duchess of Connaught or Duke of Connaught, which does he mean? Impératrice Eugénie figures four times, and in as many distinct classes. I could fill an entire page with similar examples among Roses alone, so that we should endeavour, when naming new varieties, to avoid these elements of confusion, which are becoming greater every year.

Roses named after titled persons are necessarily often of some length, but could not such as Henri Plantigenet, Cointe d'Anjou, Grande-Duchesse héritière Hibla de Bade, Grand-Duc héritier de Luxenbourg, Impératrice Maria Feodorowna de Russie, Kronprinze-sin Victoria or Malmaison à fleurs jaunes, Régierungsrath, Stockert or Conseiller du Gonvernement Stockert, and others have been shortened? Fiançailles de la Princesse Stéphanie et de l'Archidue Rodolphe was the name given to a Rose sent out by M. Levet in 1880-81, but now very sensibly reduced to Stéphanie et Rodolphe. There are also very many puzzling names for the average amateur to pronounce and spell, while considerable confusion is caused by one speaker pronouncing them correctly, and another in the English tongue as spelt.

I often hear complaints that a grower has forwarded the wrong Rose under a certain name, the purchasers getting a variety quite distinct from that desired, and utterly uscless for their purpose. Even in a first-class Rose nursery such an error may easily occur, unless the class or section to which the desired Rose helongs be also given. Classes are a great pitfall to amateurs, but this duplication of well-known names is becoming far worse. Can any reader suggest a

remedy? A. Poper.

GROWTH OF TREES IN NEW ZEALAND.

PROBABLY some of our readers may be interested in the following details of the growth of trees in New Zealand, Mr. T. W. Adams, an extensive sheep farmer, of Greendale, Canterbury, has for many years devoted considerable time and attention to arboriculture, and has got together a large number of trees, of different species, Pines especially. A few months ago, at a show in Canterbury, Mr. Adams exhibited no less than sixty cones, the fruit of as many kinds of Pines. Having so large an area of trees, and being an enthusiastic arboriculturist, I wrote to him, asking if he would kindly take the trouble to measure some of his trees, their height, circumference, and general growth, for publication, as I thought such details might be of interest. In restionse, Mr. Adams has obtained the measurements of a great many trees, and the other day I received the following report from that gentleman, for which I thank him very much. W. M.:-

"Mr. W. Morgan: Dear Sir, by the mail to-day I am forwarding the promised paper. I have been long, very long in preparing it, and now it is not so complete as I should have liked to have had it, but it takes a good bit of time to take the measurements of the trees, especially as they are scattered over a considerable area. When the first settlers took up the land on the Canterbury Plains, they felt very keenly the want of firewood for domestic uses, and also shelter from the furious gales that blew unchecked

across that extensive plain. Stimulated by the Forest Tree Planting Encouragement Act, and the desire to make their surroundings more comfortable, many farmers commenced to plant considerable areas; and now look where you will, groves of gum, wattle, and Pines meet the eye. And if even the extensive treeless tracts of pumice in the Auckland province are to be clothed with timber, much valuable information could be gleaned from the experience of planters in Canterbury. Seeds, too, of a very large number of species of hardy trees could be obtained from there.

"The list of trees enumerated in the following table does not contain more than half the number of species growing here. And as the area planted on this farm exceeds 110 acres, a good opportunity is given of testing the value of any tree, especially as in most cases a considerable number of each kind have been planted. There are many difficulties in the way of stating the exact rate of the growth of trees, but the figures given to represent the rate of growth will be useful, I representing the fastest growth, and 10 the slowest. But there are many things these figures will not explain: for instance, plant Wattles and Pinus radiata together, and for the first five years the Wattles will most likely lead, but after that the Pines will forge ahead of the Wattles, and leave them entirely in the rear. And so with many others; but the estimate made is from the experience of many years, and in most cases with a considerable number of plants of each variety, -- I am, &c., T. W. Adams,"

Name of Species.	Height of		Girth of Pole	Rate of Growth,	Fruiting Commenced.	Remarks.	Name of Species	Height of	I rce,	Girth of Bole.	Rate of Growth.	Fruting Commenced.	Remarks.
Abies Pice () alba (White Spruce)	ft 17 17 25	6	in. 14 30	6.5	1890 1896	A most useful ornanental free. Climate of Canterbury Plains too dry for it.	Fagus sylvatica (Beech)	ft.		in.	5		Is now fruiting freely in Hagley Park, Christchurch.

THE GENUS BRODLEA AND ITS ALLIES.

(Continued from p. 139.)

SERIES II. - continued.

Group 5 (Tritelein). — Flowers few in an umbel; pedicels not articulated at the apex. Ovary sessile.—South American.

These are the South American species of the subgenus Triteleia, which have never till now been published under Brodiza, and which stand therefore in the Kew Index under Milla, where they were placed in my Monograph of 1872. Except uniflora, they are little known in cultivation; and as they are fully described in my Monograph, I shall not repeat the descriptions. They fall into two sets, one with a

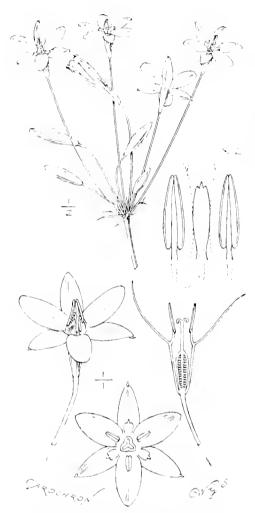

Fig. 79.—BRODLEA, PROBABIA GRANDIFLORA, (See Gordeness' Chronicle, August 22, 1896, p. 213.)

comparatively long funnel-shaped, and the other with a short campanulate perianth-tube.

- * Perianth-tube funnel-shaped, usually as long as the segments.
- 26. B. Leichtlini (Milla Leichtlini, Baker, in Bot. Mag., t. 6236). Chilian Andes.
- 27. B. sesiliflora (Milla sessiliflora, Baker).

 Patagonia.
- 29. B. uniflora (Triteleia uniflora, Lind). Bot. Reg. t. 1921). Buenos Ayres.
- Var. conspicua (Triteleia conspicua, Paker, in Sand Rev. Bot., t. 43).
 - Var. Tweediana (Milla Tweediana, Griseb.).
- 30. **B. Sellowiana** (*Tritelcia Sellowiana*, Kunth). Monte Video and South Brazil.
- 31. B. nivalis (Tristagina nivalis, Poppig Nov. Gen., t. 140). High Andes of Chili.
- 32. B. Poppigiana (Triteleia Poppigiana, C. Gay). Chili.

- ** Perianth-tube short, campanulate.
- 33. B. setacea (Milia seturca, Baker). Tucuman.
- 34. B. hirtella (Milla hirtella, Baker. Triteleia hirtella, Kunth). Monte Video.
- 35. B. subbiflora (Triteleia Berteroi, Kunth. Alliam subbiflorum, Colla). Chili.
- 36. **B.** vittata (Milla vittata, Griseb.). Entre Rios.
- 37. **B.** brevipes (*Tritdelia brevipes*, Kunth.). Chili.
- 38. **B.** bivalvis (Tritchia bivalvis, Lindl).
- 39. **B.** violacea Tribbia violacea, Kunth). Chili.
- B. Philippiana (Triteleia gravilis, Philippi).
 Araucania.

Group 6.—Perianth tube short, campanulate; segments spreading. Filaments short, broadly winged. (Calliprora, Lindl.)

41. **B.** ixioides, S. Wats. (Ornithogalum isioides, Ait.; Calliprora lutea, Lindl., Bot. Reg., t. 1590; Hook., Bot. Mag., t. 3588).—Leaves two to three, mirrowly linear fleshy. Poluncle 1 to 2 feet long. Flowers 10 to 20 in an umbel; pedicels 1 to 2 inches long. Perianth bright yellow, \$\frac{3}{2}\$ to 1 inch long; segments oblong, longer than the tube, keeled with green. Filaments short, furnished with a broad wing on each side, with an acute tip, like the Alliums of the section Porrum sig. \$1. Coast ranges of California, northward to Oreg m.

Fig. 80. BRODLEY HIST ROCORDUM) LACTEA,

42. **B.** lugens (*Tritelia lagens*, Greene).—Habit and size of the last, but the perianth deep saffroncoloured within, the tube and midrib of the segments brownish-black, and the wings of the filaments without the terminal teetb.

California. Discovered by Dr. Greene on mountains behind Valaville in May, 1886. Not figured.

43. **B.** scabra (Calliprova scabra, Greene, in Erythrea, iii., 126.—Very like E. irioides, but the margin of leaves, pedanele, and pedicels scabrous. Perianth bright yellow, half an inch long; segments ovate, twice as long as the tube, distinctly keeled with brown. Cusps of the filaments very small, erect; anthers white.

Common in the Middle Sierra Nevada of California. Our only authentic specimens are in a fine collection sent recently from the Sequoia region by Mr. G. Hansen. Not figured.

Var. (1) anilina, Greene. -Leaf-margins and peduncles less scabrous than in the type; pedicels purplish, and anthers blue. Same locality as the type.

Group 7.—Perianth-tube very short, campanulate. Stamens uniseriate from the throat of the lobe; filaments short, lanceolate.

44. B. hyacinthina (Hesperoscordum hyorinthinum, Lindl., II. Lewisii, Hook.). Leaves two to three, linear, $\frac{1}{4}$ to $\frac{1}{2}$ inch broad. Pedancle 1 to 2 feet long. Flowers ten to thirty in an umbel; pedicels $\frac{1}{2}$ to 1 inch long. Perianth purple, $\frac{1}{2}$ inch long; segments ovate or oblong, thrice the length of the tube. Ovary shortly stipitate.

Var. 8. better, S. Wats. (Hesperoscordum lacteum, Lindl., Bot. Reg., t. 1639).—More slender than the type, with white flowers and longer pedicels (fig. 80).

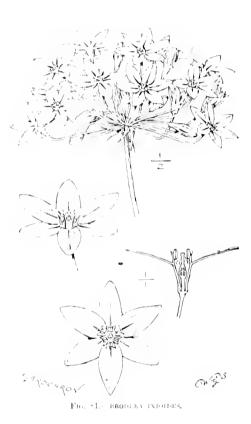

From Central California northward to British Columbia, frequent in moist ground.

45. **B.** lilacina (Triteleia lilacina, Greene). Peduncle less then I foot long Flowers ten to fifteen in an umbel. Perianth hlac-purple, \(\frac{1}{2}\) inch long. Stamens half as long as the perianth-segments; filaments hardly at all dilated.

Amador county, Sequoia region, California; discovered in 1886 by Mrs. M. K. Curran.

This concludes the list of all the species with which I am acquainted that fall under the genns Brodian, as defined by Bentham in the Genera Plentarium. I must on another occasion say a few words about three or four species allied to Brodian, which he admits as constituting distinct genera. J. G. Buker.

(To be continued.)

PHYSICAL PROPERTIES OF BORDEAUX MIXTURE.

(Cateraul from p. 428.)

exposed in a garden in an open place. After April 13 they were watered simultaneously by all the rains that fell. When it did not rain for some little time, each jur was given an equal quantity of rain-water, which had been collected in advance. Each dialiser was placed separately in a funnel draining into a testube, in which any water poured on the apparatus finally collected. Every two or three days the water from each of the five apparatus was removed simultaneously and analysed separately. The following shows the order of appearance of the copper in the water which had drained through the mixture:—

 Mixture No. 1
 April 17

 Mixture No. 2
 April 19

 Mixture No. 3
 April 24

 Mixture No. 4
 April 25

 Mixture No. 5
 April 30

Other tests of the same nature, made by washing with rain-water leave; of Spindle-wood and Box-wood (Buxus), previously sprayed with these same five types of Bordeanx Mixture, gave analogous results. In general, the copper appeared in the water which had washed the leaves more quickly when the mixture contained less lime."

In 1890, the same authors * reported another experiment showing that Bordeaux Mixture, with I kilogramme of copper sulphate and 300 grammes of lime to 1 hectolitre of water, after being evaporated at 39° C., and left for days, gave no trace of soluble copper when washed in distilled water. They also state that it is the carbonating of the lime which, when completed, allows the copper to dissolve. This neutralisation proceeds very slowly in dry air, and is greatly favoured by a gentle rain of short duration. Donbtless showers, dew, fog, and even rather damp air favour the transformation. † The solvent action of rain-water after all traces of lime in the mixture have been neutralised, may probably be explained by the following hypotheses:-The ammonia or nitrates contained in rain-water dissolve a small amount of copper; the carbonic acid in solution probably dissolves some copper with chemical change; pure water, free from calcium hydroxide, dissolves slight amounts of conner hydroxide.

Regarding the first hypothesis, it is interesting to note that rain-water often contains quite appreciable amounts of nitrogen, especially in the form of ammonium carbonate, ammonium nitrate, and ammonium nitrite. The results of an investigation by Failyer and Willard on the rain falling t at Manhattan, Kans., from 1886 to 1890, are of interest in this connection. From the tabulation of results by single rains for 1888-89 it can be readily seen that the amount of nitrogen per litre is greater in case of light showers than for heavy rains. In rain falling in showers of about 2.5 millimètres or less, the amount of nitrogen in the form of ammonia was frequently 2 to 7 milligrammes per litre, and in the form of nitric acid 3 to 6 milligrammes per litre. On one occasion there were 12:227 milligrammes of nitrogen per litre (10:376 milligrammes as ammonia, and 1.851 milligramme as nitric acid). results for the four years from March, 1886, to March, 1890, give the mean total nitrogen as 0.522 milligramme per litre, of which 0.888 was in the form of ammonia, and 0.156 in the form of nitrates.§ Petermann and Graftiau || found from an investigation of all precipitation from January, 1889, to December 31, 1891, that at Gembloux, Belgium, the average amount of nitrogen per litre was 1.49 milligramme, of which 1:14 milligramme was ammoniacal and 0.35 nitric nitrogen. This makes the percentage ratio between ammoniacal and nitric and nitrous nitrogen 76 to 24; while at Rothamsted it is 75 to 25, at Montsouris 73 to 27, and at the German and Italian stations 73 to 27. "The weight of nitrogen in the form of ammonium carbonate exceeds, therefore, that of the nitrogen in the form of ammonium nitrate or nitrite." The content of meteoric water in combined nitrogen was found by Petermann and Graftian to be very variable; but, nevertheless, one fact of general interest appears to bave been brought out, viz., a decrease of nitrogen from April to June or July, when the minimum is reached, and then an increase to a maximum in February. The amount of precipitation followed an exactly inverse rule. It is particularly interesting to note that fog, snow, and frost are characterised by a very large nitrogen content. In three cases the amounts of nitrogen in fog per litre were 2.60, 5.64, and 5 milligrammes. As to the nitrogen content of dew, little

seems to be known. From the high content of fog, however, it may be suspected that dew also is rich in combined nitrogen. These very small amounts of carbonate, nitrate, and nitrite are doubtless of great importance in effecting the solutions of small amounts of the nearly insoluble copper salts present not only in Bordeaux Mixture, but in many other fungicides. Probably cupro-ammonium compounds are formed which are soluble in water. As to the details of the process of solution, however, little is known.

It is quite probable that the carbonic acid dissolved in atmospheric water may dissolve small amounts of the cupric hydroxide. However, the amount of CO2 present, even in a saturated solution, is very small. Puchner* found the amount of CO, in the open air in the vicinity of Munich, Germany, to vary constantly and considerably at all heights observed (1 centimètre, 2 mètres, and 10 mètres above the ground). The following table illustrates the great extent of the variations, the amounts being the cubic centimetres of CO, contained in 10 litres of air, all observations being reduced to 0° C. and 760 millimètres pressure :-

Amount of Carbinic Acid in the Air in an Open Fuld near Munich, Germany.

-				
	Height.	Extremes	Means	Variation of Minumal Content.
				Per cent.
	1	Day 1/998-6/805	4.517	242.30
1	centimètre above ground	Night 1:750—1:318	2.568	14374

	210.1114	Mean . 1:583 - 6:317	4 471	241 01
		Day 1:583-4:181	2.598	155159
0	metrès above	Night 2:005-4:888	2.893	144:28
	Eronna . (Day 1:583-4:484 Night 2:005-4:888 Mean 1:794-4:689	2.896	$164^{\circ}93$

It was observed that wind diminished and snow increased the proportion of the CO, in the air. Puchner made many observations on air from very different situations and under as diverse weather conditions as possible. In the great majority of determinations (1527) the content varied between 2 and 5.5 volumes in 10,000 volumes of air, and averaged 3:67 to 10,000.

According to Bunsen and Pauli,† one volume of water under 760 millimètres pressure dissolves:

	Δt -		Parts by Volume of CO,			
0 ° C.			1:7967			
5° €.			1 4497			
Ino €.			1:1547			
15° €.			1:0020			
20° C.			0.4014			

According to Regnanlt, ‡ the specific gravity of CO2, compared with air is as 1 to 1 5341. If there were 3.67 parts by volume of CO, to 10,000 of air, the average as given by Puchner, the pressure would be of course 0.000367 atmosphere, and 1 litre of water saturated with CO2 would contain § :-

	-14		Milligrammes CO
Degrees C	1	Degrees F.	•
5	-	41	0.94
16		59	0.05
20	i.	68:2	0:55
	i.		

Pachner, II Untersuchungen üher den Kohlensauregehalt der Artmosphare (Forsch, Geb. Agr. Physik, 15, 1892, pp. 296-383; reviewed in Biedermann's Centralbl. Agr

The extreme variations in content of the air in CO., as given by Puchner, would have caused the amount to be halved at minimum content, or doubled at maximum. The amount present in rain or dew may sometimes be even less than would be indicated by the figures given above, since the water might not be fully charged with CO2 in all cases. Gayon* found that I litre of water charged with CO., at ordinary pressure, was able to dissolve 40 milligrammes of cupric hydroxide at a temperature of 15° C. If fully saturited, this amount of water at 15° C, and 760 millimètres pressure would contain 1.002 volumes of CO., weighing 1.8722 gramme. This would indicate that the carbonic acid contained in water can dissolve about 2.15 per cent. of its own weight of cupric hydroxide. It seems scarcely possible that the minute quantities of CO, contained in rain-water or dew alone could dissolve enough copper to poison any but the most delicate plants. Probably, as claimed by Gayon, the copper hydroxide present is slightly soluble in pure water. Nageli † found, as will be seen later, that the purest of distilled water would absorb enough copper from carefully-cleaned copper or gold coins (one-tenth copper) to make the water highly poisonous to Spirogyra after a few hours. It is possible that the drops of rain or dew standing for some time on the leaves or other parts of plants may absorb from superficial cells sugar or other substances that may serve to increase the solubility of the copper. Some colour is given to this hypothesis by the observation of Busgen, + who suspended carefully cleaned Grapes in water, so that the pedicel and point of attachment were not we tel, and after twelve hours detected sugar in the water. He also noted in his study of germination of parasitic fungi that the germ-tubes of many species are attracted to the boundaries between two epidermal cells where they penetrate. If leaves are placed in water full of bacteria the latter collect at the boundary-line between the cells, proving, in Busgen's opinion, that there is a faster exomosis of dissolved matters here than over the lumen of the cells.

The germ-cells of many parasitic fungi are strongly attracted to the guard-cells, as are also bacteria. Busgen succeeded in obtaining a thick black procipitate on the epidermis of leaves of Eranthemum pulcheltum (Acanth.) and Barbarea vulgaris (Crucif.) that had been wetted with a few drops of ammoniacal solution of silver nitrate. Usually the cpidermal cells remained entirely free from the precipitate. Only once, with Eranthemum pulchellum, was a heavier precipitate obtained, and this was along the boundaries of the epidermal cells. The wall was found to have no power to precipitate the silver solution, so the author concluded that the precipitate was caused by some matter which had diffused into the ammoniacal silver nitrate from the interior of the cells. It may be that the guard-cells, lacking, as they do, intercellular connections with the neighbouring cells, § may more often contain a great excess of the products of assimilation. Now, according to Brown and Morris, || the first production of assimilation is cane-sugar, and only when it accumulates in excess is starch formed. Moreover, the maltose formed from the starch under the influence of diastase may be like cane-sugar and syrup in its action on copper salts. Fresenius ¶ states

that in the presence of sugar or similar organic substances, caustic alkalies produced precipitates which are soluble in excess of the precipitants. Sugar and sirup have been used extensively in France to dissolve in part the cupric hydrexide and basic carbonate occurring in fungicides.

It would take but very little sugar to have as much solvent power as the traces of ammonia and CO_2 in rain or dew. Of course it is possible that other substances besides sugar might find their way from the plant-cell to the drops of liquid containing the copper, and aid in dissolving it. Pons* feund that although neutral and acid salts of copper are strongly insoluble in fats and fatty matters, the hydrate and basic salts are rather easily soluble. He believes the fatty matters of the cuticle of plants are comparable with animal fats and net with wax, and consequently that they would be likely to exercise a solvent action on copper salts.

Finally, it is possible that substances secreted or excreted by cells of parasitic fungi may effect the solution of a small amount of copper. The ferments and cements secreted by the hypha tips of many parasitic fungi, especially when they come into contact with a solid body, and in case the solid particle contains copper, might dissolve a considerable amount just about the delicate growing tip.

If, as is quite possible, the copper is quickly absorbed by the fungus cells, the solvent could then take up another portion, which in turn would be absorbed by the fungus, and so on. In this manner poisoning might ensue, even though the copper were only very slightly soluble. From what has been said, it can be seen that further researches on the conditions governing the solubility of the copper compounds used as fungicides are very much needed. Scarcely anything has been definitely settled. Almost all writers have overlooked a number of the conditions influencing solubility. Extract from "Bulletin No. 9, U.S. Department of Agriculture," Concluded.

THE APIARY.

PACKING HONEY FOR TRANSIT BY RAIL.

Many bee-keepers after selling their honey eften find it difficult to get it to its destination in safety; but a good and cheap way of sending away sections is to get a "No. I Tate's cube sugar-box," which will require packing at the bettom (outside) with soft hav or waste, and covered over with canvas or sacking. and tacked up round the box for about 3 inches, this preventing any damage being done by rough usage in transit. The box will take three erates of sections, each holding twenty-four 1-lb. sections; the crates should be made a little smaller than the bex, to allow the ends and sides to be well packed with rolled newspaper to keep them from shaking. Two small pieces of wood should be attached to the crate on each end, to act as handles to lower into box by means of strong string. Thin pieces of wood 44 inches deep should be placed between the rows of sections in each crate, to keep them firm, and a sheet of newspaper laid over the top of each crate will prevent any of the sections being spoilt if any honey should run from the crate above; this little precaution will often prevent the loss of a good many sections. A eushion stuffed with shavings or chaff should be placed on the top crate; the lid should be then screwed down firmly. It has also a small erate fixed to it on the top, with glass sides, showing a dozen sections; this will prevent the case from being roughly treated, when it is seen to contain honey. A case of this sort can be sent over any railway at a cost of about one farthing a pound (owner's risk), without any damage being done, if the directions as given are properly earried out. Below is a rough sketch of ease, which can be fitted up at a very nominal cost.

PACKING RUN HONEY.

In sending a quantity away, a good plan is to borrow a milk-churn from a dairyman, which will hold

over 1 cwt. The a piece of muslin over the top before the lid is put on, and fasten with a sealed label. In sending away smaller quantities, secure a few sweet tins holding about 13 lb. each; the over with cloth or muslin, as in the above case, before placing on lid; pack tins in box, and pack round firmly with shavings to keep firm (see fig. 82).

In all cases in despatching honey, place a label with words on, in large letters in red ink, "Honey, with care," adding date, and time of despatch, if by rail; and write to the purchaser a day or so before, telling him by what train he may expect the consignment.

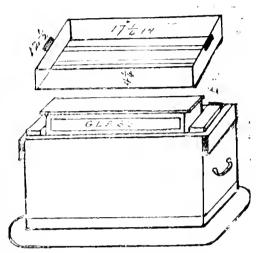

Fig. $82 \to 4$ tate sugar-box, filted to hold chairs of cases of honey

WINTER FLEDING.

Candy-cakes should be placed on hives where feeding with syrup has been discontinued, and they should be placed over the top of the brood-uest to allow the bees to get it without much trouble. Do not allow more than seven or eight frames to be left in hives, for the sake of warmth; a good plan is to place an empty frame in the centre of the brood-chamb r, to allow them to cluster on it closely.

VENTILATION.

Now robbing has ecased, it is as well to open the entrances a little wider to give the bees more air, as nothing tends to dispel damp so much as ventilation.

THE NEW ZEALAND FLORA.*

Ir will be remembered that the most famous of modern navigators, Captain Cook, was accompanied on his first voyage by two naturalists who took their place amongst the foremost scientific men of the day -Sir Joseph Banks and Dr. Solander, the entire cost of the natural history investigations made during the voyage being defrayed by the generosity of the former. Captain Cook first landed on the shore of New Zealand at Poverty Bay, on Sunday, the 8th October, 1769, and subsequently visited Tolaga Bay, Opuaragi (Mercury Bay), the Thames River, the Bay of Islands, Queen Charlotte Sound, Admiralty Bay, &e, during which the naturalists collected about 360 species of flowering plants and Ferns. But they were no mere collectors: folio drawings of most of the plants were made by Sydney Parkinson, one of the draughtsmen engaged for the voyage, and on the return of the expedition to England were engraved on copper; while excellent MS, descriptions were prepared by Dr. Solander, the entire cost being defrayed by Banks. Unhappily, these plates and descriptions have never been published. At the instance of Sir James Hector, the Board of Governors of the New Zealand Institute authorised the necessary outlay for copying the descriptions in Lendon, and

* Notes on MS Descriptions of Collections made during Captain Cook's First Voyage. By T. Kirk, F.L.S. Read before the Wellington Philosophical Society, Sept. 25, 1295.

the MS, is now submitted for inspection. Sir Joseph Hooker, in the introduction to the original Flora Novæ-Zelandiæ, speaks of Solander's MS, in verv high terms, and from such references as I have already been able to make, I can heartily indorse his testimony to its merit. It is most unfortunate that for a century and a quarter, plates and descriptions alike have remained inaccessible to local botanists. Had they been published by their authors, the bosany of New Zealand would have been far better known sixty years ago than was possible under the conditions that then existed, a large amount of error and confusion would have been avoided, and the synonymy of many species greatly simplified. Many of Selander's names, which in the majority of species are most appropriate, have been applied to different plants, while others have not come into use in any way, many New Zealand plants having been described by Continental writers who had no knowledge of Solander's excellent work.

It is perhaps not generally known that Sir Joseph Banks was extremely anxious to accompany Cook on his second voyage, and succeeded in having a grant of ±4.000 voted by the House of Commons to pay for the necessary assistance; but, owing to the resolution not being sufficiently well defined, the Comptroller of the Navy, who from some obscure cause wished to thwart Banks, succeeded in preventing him from joining the expedition. John Reynheld Forster, and his son George, were appointed chief naturalists. and received the sum voted by the Government at the instigation of Sir Joseph Banks. Their betanical work, although of great value, was not equal to that of Banks and Solander either in extent or quality. Their collection of New Zealand phenogams and Ferns comprised only 160 species, of which about 150 were published in George Forster's Florula Insularum Australium Prodromus. A few others were described in Characteres Generum and De Plantis Esculentis Insularum Oceani Australis Commentatio Botanica, but the descriptions are very meagre, and suffer greatly by contrast with the excellent work of Dr. Solander. The specimens collected by the Forsters were arranged in fasciculi, and distributed to various museums and private collections. Unfortunately, in some instances a plant has received different names in different fasciculi, resulting in a large amount of error and confusion. Their drawings of the plants and animals collected during the voyage were purchased by Sir Joseph Banks for £400, and are included in the Banksian Collections now in the British Museum. It is worth while to remark that the three works already mentioned, with another. De Plantis Mayellanicis et Atlanticis, all published between 1776 and 1787, comprise all that was published respecting the botany of Cook's first and second voyages, and therefore all that was published respecting the botany of New Zealand prior to M. A. Richard's Essai d'une Flore de la Nouvelle Zélande, in 1832. In this connection I should like to state my sense of personal indebtedness to C. R. Carter, Esq., who, at my suggestion, has kindly placed copies of these books in the fine collection of works on New Zealand, which he has so generously presented to the New Zealand Institute. Apart from their special value to the botanist, a considerable amount of historic interest must be attached to them by all New-Zealanders.

The Minister of Education has sanctioned the small outlay necessary for obtaining a complete set of proofs from the Banksian drawings of New Zealand plants in the British Museum, and copies reduced by photo-lithography will be printed at the Government press, to form a special volume of illustrations for the Student's Flora of New Zealand, now in preparation. The Ms. volume of descriptions will be bound for the library of the New Zealand Institute.

I am reluctant to allow this opportunity to pass without expressing my thanks to Sir James Hector for his continuous and loyal efforts to insure the new Flora being made as complete and exact as possible. When its publication was first mooted some years back, he advised the Government that, as a simple matter of business, it would be wise to send the

Pons, B. Le cuivre et le mildiou (Jour d'Agr. prat., 4° ann., T. H., No. 34, 1890, p. 276.

editor to London to examine the collections of New Zealand plants made by the early botanists, and especially the vast accumulations that have been sent to Kew during the last thirty or forty years. The same course had previously been suggested by Sir Joseph Hooker, but had not been brought under the notice of the Government. When the Government declined to adopt the advice, Sir James warmly supported the proposal to secure the MS. copy of Banks' and Solander's unpublished Flora, which is now before the meeting, and thus rendered material assistance. He has done everything in his power to facilitate the work, and render it as nearly perfect as possible.

NOTES ON PLANTING BUSH FRUITS.

BUSH fruits, by which are meant Currants, Gooseberries, Blackberries, and Raspberries, being mostly European plants, are easily grown, which may, perhaps, account for plantations of them often being found in a neglected condition. The bushes succeed best upon loamy soils, sheltered yet open to the sun, and on land sufficiently elevated as to suffer but little from spring frosts. Light dry soils are unsuitable for these fruits, and particularly so in southern English counties. The unsuitability of such land may be, however, in a measure, counteracted by planting in partially-shaded positions, and by applying dressings of heavy soil and decayed cow-manure. As an instance of this, I have Gooseberry-bushes growing satisfactorily upon a north border, shaded by a wall in a garden, whilst they failed in the open quarters. In preparing for planting, the first consideration is to attend to the proper draining of the soil, which is best secured by 3 inch tile drains, placed 3 feet in depth, and 15 feet more or less apart, according to the character of the subsoil; always bearing in mind that it is safer to err in placing them rather closely, than by having them too far asunder. The soil should next be trenched to a depth of at least 2 feet, and as the top spit invariably consists of the best soil, it should be kept on the surface; while, as the operation proceeds, deeprooting weeds, and large stones should be removed. The best results follow when this work is done in fine weather, i.e., at a season when the soil is workable; and it is advisable to accomplish it some months previous to the time of planting, to allow of its settling. After the trenching is completed, the land should receive a liberal dressing of decayed farmyardmanure, that from cow-sheds, as already stated, being best for light soils, while stable-manure is preferable for that of heavy soils, and this should be forked into the surface. The most should be forked into the surface. The most suitable time for planting is the end of October, or early in November, although it is better to defer it to a later date than do it when the soil is wet, and will not erumble. Should the bushes be received when the soil is in a wet condition, they should be laid in by the heels, till a favourable time for planting offers. In planting upon good soil, all the varieties of Currants and Gooseberries grown as bushes should stand 6 feet apart each way, and care should be taken that they are not placed deeper in the soil than they were when lifted from the nursery lines. Straggling or badly-bruised roots must be removed, and the remainder spread out at the bottom of the hole, making the soil firm about them, completing the job by mulching each plant with short manure. The cordon mode of cultivating Gooseberries has its advantages, and plants of this description can be planted in lines in the open ground, and look nice by the sides of the walks, or upon walls. They are very useful, owing to the fruit keeping till late in the autumn, when grown upon north walls. Gooseberries and Red Currants may also be grown as standards, and compact-growing varieties, upon 3 feet stems neatly staked, and carrying crops of tipe fruit, are certainly ornamental. Raspberries, particularly the strong varieties, should be planted in rows at 6 feet apart, and the plants at 2 feet asunder in the rows.

For ordinary requirements the growing of numerous varieties of these fruits is not advocated, although several are necessary in order to include the best for special purposes; and in conclusion 1 will name a selection of good varieties, although others equally good might be enumerated.

Gooseberries. -For cooking when green: Antagonist, Industry, Keepsake, Lancashire Lad, Crown Bob,

and Berry's Early Kent. For flavour: Early Sulphur Glenton Green, Whitesmith, Warrington, Green Gascoigne, Green Sage, Red, and Yellow Champagne. For bottling: Rumbullion. For preserving: Warrington, Ironmonger, and Keen's Seedling. For exhibition: Speedwell, Dan's Mistike, Leveller, Catherina, Telegraph, Thumper, Antagonist, and Snowdrep.

Currants.—Black: Ogden's Black, Lee's Prolific, and Black Naples. Red: Cherry-Currant, Reine Victoria, Red Dutch, and La Constante (the latter is a valuable late variety). White: White Dutch, and Cut-Leaved.

Raspberries.—Red: Superlative, Semper Fidelis, Carter's Prolific, and Baumforth's Seedling. Yellow: Yellow Antwerp. Autumn-fruiting: Belle de Fontenay. Thomas Coomber.

KEW NOTES.

ORCHIDS AF KEW .- Among the many species at present in flower in the Orchid-houses at Kew the following are noteworthy. In addition there are many in flower which although not showy, are yet interesting botanically. There is promise of a good display of Dendrobiums, Cattleyas, &c., in the fine growths made this year under the influence of the exceptionally large amount of sunshine experienced during the summer: - Angraecum bilobum and the variety Kirkii, A. Scottianum, Cattleva labiata, C. aurea, C. Holfordii, C. Bowringiana violacea, Cirrhopetalum ornatissimum (what a nauseating odour the flowers of this plant have !, C. pulchellum, Cycnoches Egertonianum 'a spike 18 inches long, bearing numerous yellow and black purple flowers with cariously bunched lip), C. chlorochilon, C. Loddigesii, Cypripedium concolor, C. Stonei, C. Charlesworthii, Epidendrum prismatocarpum, Habenaria carnea, Lelia elegins, Odontoglossums, various; Oncidiums, various; Phalenopsis Esmeralda, P. Lowii, P. violacea, Sobralia sessilis, true, a lovely species; S. Wilsoni, apparently only a variety of S. macrantha; Stenoglottis longifolia, and Vanda corulea. W. W.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. Whire, Burford, Dorking.

Catasetum, Mormodes, and Cyanoches.—Plants of these species now out of bloom, or which have finished their growth without flowering, should now be removed from the East Indian-house to a very light position in the Mexican-house, and on no account be shaded at this season, direct sunlight being necessary to harden and mature the latest-made pseu-lo-bulbs. The plants will require scarcely any water in dull weather, but plenty after sunny days till the leaves have fallen, when, if well matured, they will need no water for a period of several months. Badly-ripened growths, on the contrary, require water once a week or fortnight, in order to preserve them in a plump state. Catasetums, after producing their first flower-spikes, if strong, frequently send out others a few weeks later, but these it is advisable to pinch off, to prevent the new pseudo-bulb being weakened and hindered in the finishing.

Olontoglossum citrosmum. — Plants which during the summer months have been hing up in the Cattleya-house, but which may have mude little progress lately owing to lack of sindlight, may be removed to a light airy position in the East Indian-house, or warm stove, keeping them well supplied with water at the root. The plants under this sort of treatment will finish up in good time, and become properly ripened before the winter sets in.

Dendrohium Phalamopsis.—The large importations offered for side at London auction rooms recently will have induced new men to attempt their cultivation, and a few hints as to the management of the plant on arrival will be useful to many. The plants on being unpacked should be closely examined for a destructive beetle usually infesting the species, and boring small holes in the pseudo-bulbs. The only means of externaination is to remove the pierced bulb, and burn it immediately. Each pseudo-bulb should be cleaned with a sponge dipped in warm water after all the decryed parts and dead roots have been removed, then place the plants in pots or baskets just large enough to hold them for one season,

making the plants firm by tying the pseudo-bulbs to neat sticks, an important point in obtaining a good root-hold, and use nothing about the roots but clean crocks. To revive the plants, itisadvisable to place them in a moderately dry intermediate-house. It is not good practice to attempt to make them suddenly plump, or to excite growth before natural activity commences, or the plants may fail to produce growths when the proper time for so doing arrives. But little moisture should be afforded for several months after potting, the crocks being merely moistened occasionally. Many of these imported plants are approaching their flowering stage, and no doubt the buyers of them will be impatient to see their plants in flower; but I would strongly advise them to pinch out every flowerspike, for the reason that flowering will debilitate the plants greatly. The cultivator should, moreover, avoid any kind of treatment that would tend to cause growths being made during the winter; but in the spring, when growth commences anew, the plants may be potted in peat and sphagnum-moss, using but a thin layer of it, and Orchid-pots small in proportion to the size of the plants, gradually inuring the plants to a greater degree of warmth. When in full growth they will require the warmest house and lightest position in it that is available.

THE KITCHEN GARDEN.

By CHARLES HERRIN, Gardener, Dropmore, Maidenhead.

Lettuce and Endive.—Some garden-frames may now be prepared for holding a number of nearly fully-grown Lettuces and Endives, which should be lifted with as large balls of soil as convenient, and transplanted in the soil in the frame at about 6 inches apart, or at such distances that they will stand clear of each other. The frame-lights should only be made use of to shelter the plants from rain and night frosts. The curled-leaved varieties of Endive are very apt to rot if allowed to get wet, and for this reason the broad-leaved Batavian Endives are the best for winter use. During sharp frosts mats or litter should be placed ever the frames. The later-raised Lettuces have not made much progress owing to the cool temperature and excessive rainfall, and it will be advisable to plant a good batch of the stronger seedlings at the foot of south and west walls and other somewhat sheltered places; the smaller ones being planted a few inches apart in cold frames, sheltering them in severe weather with mats, &c.

Cabbages.—A second planting of Cabbages should now be made. The young plants have not made much progress, and the Cabbages that were first planted out have not made gross growth, or such as might not be able to withstand the severities of an ordinary winter. The first planted Cabbages should now be lightly earthed up with the hoe when the ground can be caught in a dry state. If planted on firm ground, such as that which carried this year's Ooions, the growth will be stocky, and with the earthing up properly carried out, frost and wind will do them little harm.

Asparagus.—The stems of the plants in the permanent beds having matured, may be cut off and cleared away before the berries drop off. There is, I believe, no advantage gained by allowing the stems to remain after the leaves turn yellow. Cut them off close to the ground, and remove forthwith from the beds. The stems on plants in newly-made beds will probably continue to grow some little time longer, and this being so, they should not be removed before they are ripe. The cleared beds should be weeded either by hoeing, or by hand if the surface is very moist, and the first opportunity taken to slightly loosen the surface. The manuring of the beds is often done at this season, but in the case of heavy land, it is not an advi-able practice; but where the land is of light nature, manure may now be applied in a half-rotten state. As the roots of the plants are not injured by even severe frost, the beds are the better for being left uncovered by manure, and open to the sweetening influences of frost and wind till early spring, when thoroughly rotted manure should be used to top dress them.

Hints on Work in General.—The late successions of Celery should now be freed from the small basal leaves and the suckers that spring from the crowns, and when dry afforded an earthing-up of 1 or 2 inches in height—not more, or the heart-leaves will be over topped. The stems of fruiting Tomatos growing out-of-doors should be severed at the ground-level, the leaves removed, and hang up in a warm place, such as the back wall of a late vinery, where some of the fruits may ripen sufficiently to be useful in

the kitchen. The plants in the late sown Spinach quarter should be thinned somewhat, so that they stand just clear of each other.

FRUITS UNDER GLASS.

By W. Pope, Gardener, Highelere Castle, Newbury.

The Pinery. -The pinery in which are plants of the Queen required to ripen their fruits in the mouths of May and June, 1897, should have the temperatore gradually reduced to about 60° at night, and from 65° to 70° in the daytime, giving air, more or less, according to the conditions prevailing out-of-doors. The bottom-heat should be kept at 75°. The aim of this reduction of warmth, is the affording of a period of comparative rest till the beginning of the new vear. The plants being in pots plunged to the rim in moist tan or leaves, and not being in the neighbourhood of any hot-water pipes, will need very little water till a greater degree of heat is afforded when starting them into fruit, although an occasional examination of the soil will be necessary, great dryness at the root being dangerous. Maintain a rather moist, genial atmosphere in the house in which fruits are swelling off, sprinkling the paths and walls daily, and the surface of the bed occasionally, but the plants themselves should not be syringed. The amount of water afforded the soil must be sparing, the aim of the cultivator being the keeping of the soil in a moist, but not a wet state; and throughout the winter water may be withheld altogether as soon as a fruit begins to colour, any excess of moisture at the root at this stage and season often causing blackness at the core. A night temperature of 70° should be maintained, and by day 75° to 80°; bottom-heat being steady at 85° to 90°. Suckers on these fruiters, when of fair size, should be twisted off, and after laying in the Pine-stove to dry somewhat they should be potted into deep 6-inch pots, and plunged in a bed having a brisk heat, with the tips of the leaves nearly touching the glass. Roots are quickly formed under these conditions, and the leaves do not become drawn as is the case with suckers left on the old stools till the spring arrives. Those suckers which were potted late in the summer should be making free growth, and will be benefited by having plenty of air on favourable days, and a smaller amount of water at the roots, although these must not be kept very dry. Examine Examine them at the least ouce a week during the winter months, and afford water when it is necessary. Those standing in small pots and likely to become pot-bound shortly, may be reported into slightly bigger pots rather than run the risk of their starting prematurely into fruit. It is advisable to let the temperature fall for these young plants to about 60° at night, or 65° in mild weather by day, with a steady bottom-heat of 80'.

Cucumbers. - As the days shorten, moisture at the roots and in the air of the house must be correspondingly reduced, discontinuing overhead sprinkrelying for aërial moisture on sprinkled paths and other surfaces. Undue dryness of the soil should be guarded against by affording as much water sas will prevent flagging, or just enough to keep the bed in a moist state. Admit a little air on bright mornings, and closing early. The lateral shoots mornings, and closing early. The lateral shoots should be stopped at every joint, and all mis shapen fruits removed as soon as observed. The plants should be lightly cropped, and no fruit allowed to remain uncut after having become large enough for consumption. A few fresh borse-droppings spread over the surface of the bed at short intervals of time will be beneficial by affording a supply of ammonia to the plants, and tend towards keeping them free from red-spider. Keep free from thrips and aphides by timely light fumigations with tobacco, and dust with sulphur for mildew should it appear. A night temperature of 70° will be suitable, rising to 75° or 80° in the daytime.

PLANTS UNDER GLASS.

By JNO. McINTYRE, Gurdener, Woodside, Darlington.

Leoras.—Such of these as are now past their best and showing signs of cessation of growth, may be removed to a cooler house, and the quantity of water afforded at the root reduced, but at no time altogether withheld, or the shoots will shrivel. A late vinery, if warmth be afforded to dispel damp from the Grapes, forms a very suitable place for storing Ixoras. Here the plants may stay for three months; indeed, such quarters are very suitable for any species of stove-plants that needs to be kept cooler when at rest.

Palms, &c. — Any which from various causes have had their growth checked, should be placed in

the stove to make new leaves in readiness for use another year. This holds good of the plants that have been much employed in house-decoration, or that have frequently been sent to shows; it applies also to Cycads. I have a large plant of Cycas circinalis that was checked in its growth during the summer, and it is throwing up a fine crown of leaves under this kind of treatment. Old specimen Cycads should have their stems abundantly sprinkled. Autuumstruck stove plants of any kind, if rooted, should be placed in pots of a size likely to carry them through the winter, and put on a shelf near the glass.

Potting Soils and Composts.-Where open or closed sheds exist, and the space can be spared, the various materials used in potting plants should be got together without delay and placed therein. The loam, which ought to consist of light and heavy qualities, should have been in stack for one year or longer, for the grass-roots, &c., to have become partially decayed.

The loam that gardeners like the best is that which has been taken from a sheep-pasture or other grazing-land, but as this cannot always bo obtained, then such as comes nearest to it should be obtained. The country gardener can usually stack his turfy soil in the open one year or more before he uses it: the town amateur, on the other hand, buys what he requires of the soil-dealer, and has but little choice in the matter of quality, but he at least should stipulate for being supplied with turfy soil-not sub-soil, destitute of fibre. If turf be cut at home, it may range in thickness from 11 to 3 inches, according to the quality of the soil-thick on good loam, and thin on poor or gravelly ones. When carted to the soil yard, stack the sods or turves solidly together, and finish off the heap as a ridge or a cone, with a sharp slant to throw off the rain; and keep it free from weeds. When the grass grows out at the sides, as it will do in the summer, shave the sides thinly with a sharp spade, and then it will not give any further trouble. Where the potting shed is furnished with soil-bins, these should be filled. Do not omit to store in the dry a sufficient quantity of well decayed and partially decayed leaf-soil, These should be passed through fine meshed sieves to remove undecayed portions, sticks, and rubbish. For the making of leaf-soil as many Oak, Chestnut, and Beech leaves should be collected as possible—one can scarcely have too much of it in the garden. The leaves of the Lime, Elm, Horse Chestnut, and Sycamore do not make such good leaf-mould, although when mixed with dung they make fairly lasting hot-beds. Peat, both hard and soft, is to be met with near some large gardens, the former being good as a pottingsoil for hard-wood plants and others, which like those have fine hair-like roots, and that do not like frequent root disturbance; the latter does well for growing Ferns, some kinds of Orchids, Achimenes, Gesneras, Anthuriums of the leafy species and varieties, and for mixing with loam and leaf-mould for a great variety of uses. Like loam, it should have been in stack for at least a year before it is used for potting, although when employed in conservatory borders it may be used in a fresh state at or near the bottom of such, being very good at that depth for keeping the borders well drained, decay taking place but slowly when it is removed from the action of the air. Failing a home supply of peat, recourse must be had to the soil-dealer; and the buyer should insist on being supplied with an article which being out at least one year, is fit for immediate use in potting his plants. Then there is Orchid-peat and sphagnummoss, which every Orchid cultivator must have in store. A stock of sand, both pit and river kinds, should be stored, and it ought to be clean, that is, free from loam or other soil. Sea sand answers well for most things, and if it be stored for a time out-of-doors, the rain frees it from much of the salt particles it contains. The above constitute the greater part of the gardeners' laboratory, and he merely requires a few such aids to growth as dried cow-doug, fowls', or pigeons' dung, that has been fermented in a big heap; some well-decayed stable-dung passed through a half-inchmeshed sieve, a bag or two each of crushed bones, bone-meal, Peruvian-gnano, Viue-manure, and superphosphate of lime, to be prepared for any emergency.

THE FLOWER GARDEN.

By Hedley Warren, Gardener, Aston Clinton, Tring.

Spring Badding.—Except in very sheltered places, the plants will have become so unsightly as to make it desirable to clear them away forthwith, and proceed with the planting of bulbs and spring-flowering plants. Before digging the seil in the beds, it is generally advisable to dress it well with rotted dung, which is better for the future occupants

than summer manuring, and one dressing usually suffices for the entire year. Having made preparations for planting the beds, and having decided on the manner in which they will be filled, planting in masses of one or two harmonising colours only if the beds are small should be done. No two colours may be placed close together that would have a discordant effect, such as purple near red, or scarlet or blue with red, unless its complement yellow be in the near neighbourhood. Brown and white are tolerable, as for iustance, Wallflowers and a white Nareisus, or Tulips, or Hyacinths. Daisies of decided colours are useful as edgings, and for filling quite small beds; also Scillas, white and blue. Chionodoxas less so, the habit of the plants being more straggling. and Sapouaria ocymoides; and Forgetime Nots in variety are all of use. Plants that are of dwarf growth, such as Aubrictias. Daisies, &c., may be planted thinly as groundwork or edging, the intervening spaces being planted with Sedums, Herniarias, Autennaria, &c., or with dwarf Tulips, Crocuses, or Scillas, as may be desirable. In some instances small evergreen shrubs may be used as "dot" plants, and these serve to relieve the beds of flatness, and save the expense of using Dutch bulbs. Other springflowering plants, are alpine Auriculas, Primroses and Polyanthuses, perennial Arabis in variety, Alyssum saxatile, Pansies, Erica carnea, &c. Of bulbs there are Crocus, Hyacinths, Narcissus, Tulips, Snowdrops; tubers of Eranthis Lyemalis Winter Aconite, Ranuneuluses, &c. It should be borne in mind that in beds planted in patterns, the latter should be simple, beds thus planted usually affording the most satisfaction. A simple and telling arrangement for a circular bed about 12 feet in diameter, may be made as follows: - A central plant of Yucca recurva, a groundwork over the whole of the bed of yellow Polyanthus, dotting over the whole Searlet Thlips; and if an edging be thought desirable, using Aubrietia purpurea. Another simple arrangement may follows:—Plant a groundwork of alpine Auriculas, "Golden Spur," dotting the whole with Narcissus "Golden Spur, placing the latter not less than 9 or 10 inches apart; and where an edging is required, use the red or white Daisies. Eeds occupied solely with bulbs, or in which other plants are thinly disposed, should receive a surfacing of Cocoa-nut fibre.

General Work.—All tender plants used for bedding purposes should now be got under cover, and afforded free ventilation in mild weather. Cuttings of bedding Pelargoniums should be frequently examined for decaying foliage and flower-buds, which should be sedulously removed.

THE HARDY FRUIT GARDEN.

By G. Woodcate, Gurdener, Rolleston Hall, Burton-on-Trent.

Planting Fruit Trees .-- Before proceeding to plant on ground long occupied by fruit trees, the infertile soil of the tree stations should, to a large extent, be dug out to a depth of 1½ to 2 feet, and wheeled on to the kitchen garden quarters, where it may be spread about, and other soil from another part of the garden substituted, adding to this some pasture loam, line rubbish, and charred soil and refuse. If there are drains under the trees or in the adjacent soil, they should be examined as to their efficiency. The layer of rubble which ought always to be laid over the drain-pipes, and should not be less than 6 inches in length, should be freed from soil and then covered with thick turves. After filling in the stations with the new mixture of soil, &c., make it firm by trampling lightly if it be sufficiently dry to allow of this being done, otherwise it must be left to settle by its own weight. This sort of preparatory work should be undertaken in dry weather, planting being done as soon as the trees come to hand from the nursery.

Peach and Necturine Pruning.-The shoots of the late varieties which have borne fruit this year should be removed, and a light brushing with a new birchbroom be afforded the entire trees as soon as the leaves attain their autumnal tint, always drawing the broom from the centre to the extremities. This may require occasional doing at intervals of a week. If the fallen leaves are burned forthwith, many insects or their eggs, which might ultimately cause trouble, will be destroyed. In the borders of trouble, will be destroyed. In the borders of mmy kitchen gardens, fruit trees are planted in lines parallel with the walks, and in symmetrical In the borders of order, and when a vacancy occurs in the lines, some of the worn-out soil should certainly be replaced with that which contains more fertility, and which has not carried fruit trees in recent years. quarters intended to be planted with bush fruits of all kinds should be well dressed with rich farmyard

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

(Unre-erved Sile of well grown Nursery Stock, at The Nurseries, Sumingdale, by order of Mr. Chas, Noble, by Protheroe & Morris (six days). Dutch Bulbs, at Protheroe & Morris' MONDAY. CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—49'2°.

By the death of Baron FERDI-Baron NAND VON MUELLER, or, to give VON MUELLER. him his British style and title, Sir FERDINAND MUELLER, on the 9th inst, as announced by telegram a week ago, Australia has lost its greatest botanist, science generally one of its most devoted disciples, and humanity one of its greatest benefactors. Personally he was known to few of us, having, in 1847, left Europe to which he never returned; yet there are probably few botanists and horticulturists in the wide world who have not been in correspondence with him, or who are not in some way acquainted with his writings. Apart from an inborn egotism that marred, to some extent, all his writings and speeches, he was a most estimable man, expending his income for botanical and charitable purposes, generous and helpful in all ways. He has done more than any other single individual for the advancement of science in the southern hemisphere. A conscientious and earnest man in all that he undertook, yet withal a little unpractical!

FERDINAND MUELLER was born at Rostock in 1825, and studied medicine and natural history at Kiel, graduating there as Ph.D. Between 1840 and 1847, he investigated the flora of Schleswig and Holstein, but, so far as we know he published nothing relating thereto. At the latter date he had premonitory symptoms of phthisis, and having previously lost both his parents, he emigrated to Australia. The change of climate had the desired effect, though he never attained to a robust physique. He commenced his career as a chemist's assistant in Adelaide, where he soon attracted attention by his study of the native plants. Four years were devoted to the botanical exploration of South Australia

at his own cost, and to the last he gave valuable guidance to younger men; taking special interest in the exploration of New Guinea and the antarctic regions. In 1852, under the administration of LA TROBE, the first governor of Victoria, he was appointed Government Botanist. His first contribution to the botany of Australia appeared in the Linnea, vol. xxv., 1852, under the title of Diagnoses et Descriptiones Plantarum Novarum, quas in Nova Hollandia australi pracipue in regionibus interioribus detexit et investigarit. This was succeeded by a number of papers on the botany of the same region in Hooker's London Journal of Botany; and then, in 1855, he published in the first volume of the Transactions of the Philosophical Society of Victoria, descriptions of the interesting novelties discovered by himself in the Australian Alps. After this, not a month mortification which he never forgot, as to the last, his letters contained references to it. But, to the credit of the colony, be it said, he was retained as Government botanist at his former salary. The herbarium and library just outside the Botanic garden remained under his control; the garden itself he never entered after his removal.

In 1858-59 the first volume of his Fragmenta Phytographic Australia was published. This was continued down to about 1882, comprising eleven thin volumes, and a fragment of a twelfth, of Latin descriptions, giving evidence of the progress of botanical discovery in Australia.

In 1861 the question arose of preparing a Flora of the whole of Australia, written in English; and although it was the ambition of his life to carry this out, and for it he had

THE LATE FERDINAND VON MUELLER

passed from that time to the present without some further contribution to the flora of Australia.

In 1855-50 ho was attached to an expedition sent out under Gregory for the exploration of the Victoria River, and other districts in Central and North Australia; and as early as 1863, he had already, in his various journeys, travelled upwards of 20,000 miles! The estimation in which his labours as an explorer are held by geographers, is evidenced by the fact that a river in Queensland, a mountain in Spitzbergen, a range of mountains in New Guinea, a cataract in Brazil, and a glacier in New Zealand, all bear his name. In 1857 he was appointed to the directorship of the Melbourne Botanic Garden, a post he held until 1873, when, much against his will, he was relieved of the functions belonging thereto, in consequence of his not meeting the popular requirements of the period, and of the desirability of appointing a practical horticulturist to manage the garden. This was a bitter

so long been collecting materials, he magnanimously and unselfishly gave up the task to the late Mr. Bentham, because it was essential to its satisfactory accomplishment that the author should be able to examine the types of the multitude of previously-described Australian plants deposited in European herbaria. How faithfully and pleasantly von Mueller assisted Bentham in the seven volumes of the *Flora Australiensis* may be gathered from the prefaces to the first and last volumes of that great work.

The whole of von Mueller's extensive Australian herbarinm was transmitted to Kew, case after ease, and the whole was returned without the slightest mishap. Von Mueller's feelings towards Bentham are expressed in his written inscriptions in the first and last volumes of the Fragmenta, presented to the latter, and now in the Kew library. In the first, the dedication runs thus:—"Botanico quam maxime astimando Georgio Bentham, &c., opnsculum offert auctor," In the last, long after

the completion of the Flora Australiansis, he wrote:—Illustrissimo G. Bentham Phytographorum renerabili, Nestori Regni Plantarum Australiae probissimo, perlustratori rolumen modestum Scriptore oblatum.

These tributes to the merits of BENTHAM, whom he might have regarded in the light of a rival, are more elequent of the worth of the writer than anything we could say in his praise.

Of late years he was collecting materials for

of the utmost value to botanist and horticulturist alike. Among the multitudinous works that have issued from the prolific pen of the deceased, there is one deserving of special mention. It is that on Schet Extra-tropical Plants readily eligible for Industrial Culture, &c. The first edition, if it may be so termed, consists of a series of papers, partly lectures, delivered or published between 1857 and 1871. A second, consolidated edition, appeared in 1876, and since then augmented and revised californs have succeeded

various others, attest alike the broad sympathies and the prodigious industry of the author. The depressed financial condition of the colony hampered him in his publications, but in his last letter to us be mentious his intention to resume at once the publication of his nonograph of the Caudolleaceae (Stylidiaceae of others), to complete that of the Salsolaceae, and to bring out supplements to his monographs of Eucalyptus and Acacia, while he even hoped to bring out one more edition of his Select Plants!

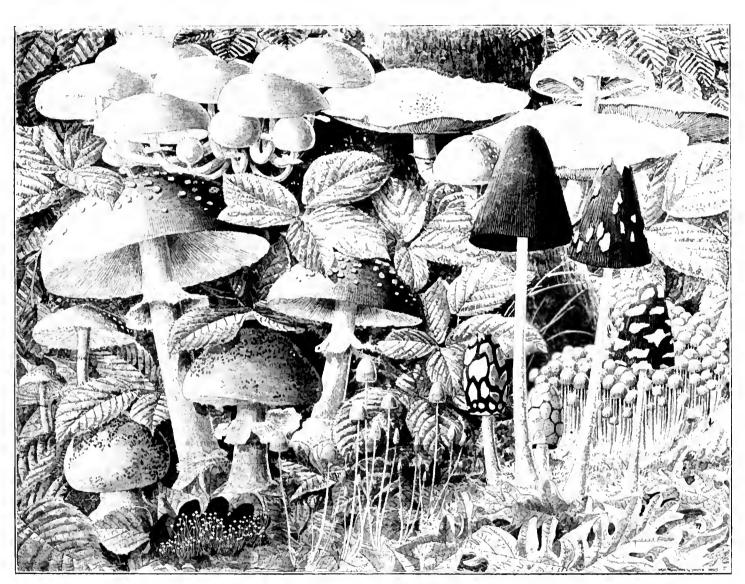

Fig. 84.-AGARICINEAL (SEE P. 466.)

a Flora of New Guinea, and published numerous leaflets on the subject, a form of publication that is not a little inconvenient.

As may be imagined from what has already been said, a complete bibliography of MUELLER's writings would fill many pages: therefore, we must be content with mentioning a few of his more important works. Prominent among these are his illustrated monographs of the genera Eucalyptus, and Acacia, and of the Orders Myoporineæ and Salsolacea, most valuable works from a practical as well as from a scientific point of view. The Eucalyptographia is, indeed, specially remarkable among similar publications. Then there are the various editions of his Census of Australian Plants, a compilation

each other until last year, when the niuth was published. From a small beginning it developed into a general handbook on plauts suitable for cultivation in extra-tropical countries. Taking the editions in the order they appeared, the fourth was in the German language, translated by our old correspondent, Dr. Ed. Goeze, Curator of the Botanic Garden at Greifswald. Then there is a French edition, conjointly edited by Mueller and Charles Naudin, and published under the auspices of the French Acclimatisation Society. Works intended to popularise the study of botany, such as the Introduction to Botanic Trackings at the Schools of Victoria—the Key to the system of Victorian plants, illustrated with numerous cuts, and

In the distribution of botanical specimens, and in the communication of plants of horticultural or economic value, he was equally energetic. There is scarcely a botanic garden hero or on the continent that has not been enriched by him; not a colony, nor a dependency which does not owe to him some valuable introduction. Eucalypts, Acacias, pasturograsses for arid climates, fruit trees, timber trees, tanning materials, perfume plants—nothing likely to be useful in any particular colony was omitted. At the same time, he was indetatigable in developing the resources of his adopted country, and directly or indirectly was the originator of many now flourishing industries. Nor was his attention confined exclu-

sively to plants, for we read of the introduction to central Australia, at his instigation, of the Camel for transport purposes.

One illustration of his zeal for horticulture is shown in the great numbers of Fellows of the Royal Horticultural Society who were proposed by him. The Society, indeed, owes no little to the unselfish action of Baron von Mueller, who, when the Society threw off South Kensington shackles, and started on its career of pure horticulture, expressed his sympathy in the way just mentioned. In leed, in the last letter received from him shortly before the telegraph brought news of his death, there was a proposal-form for the election of yet another Australian Fellow of the Royal Horticultural Society.

VON MUELLER was a most voluminous correspondent. For nearly forty years, the present writer has been in correspondence with him, and of late years hardly anything has happened with such regularity as the receipt on every Monday morning of one or more communications of some kind from Baron von Mueller. Two or three such communications were received weekly on the average, but the number has occasionally mounted up to as many as seven and even nine! The last of these communications utilised in this journal was one on a new Musa from New Guinea, printed in our last issue, p. 360. Since then, indeed, on Monday last, we received an original sketch of the inflorescence of this plant (fig. 85), which we now reproduce on p. 467, not only for its own sake, but in memoriam,

Sir F. MUELLER was at the head, or intimately associated, with every movement for the promotion of intellectual culture, not only in Melbourne, but directly or indirectly throughout Australasia. He was truly an enthusiast in all that related to the botanical and geographical exploration of his adopted country; yet, none the less, a strong supporter of the renowned musical society, known as the Melbourne Liedertafel, and other social institutions.

In a short notice, as this must necessarily be, it is difficult to do his memory justice, and yet be faithful to the truth. There is no doubt that he denied himself the pleasures of matrimony partly from conscientious motives, but particularly in order to be free to give his time and his income to his favourite pursuits; his house was blocked with specimens, so that sitting room and domestic comforts were deficient. Yet, in contrast with this self-denial. he was insatiable in his desire for titles and notoriety. This weakness caused him to publish botanical contributions in every possible organ open to him, and occasionally led him to the commission of regrettable inconsistencies in botanical nomenclature.

With all that one can say in praise and honour of his intense energy and industry manifested in spite of a somewhat delicate constitution, and one can hardly say too much, it would be affectation to ignore the fact that he needlessly added to the synonymy of Australian plants by simultaneously publishing many of them under two generic names, so that whichever view one might take of generic limits, his name would still stand as the authority! He also included in other vagaries, incomprehensible, considering his vast experience. For example, he reduced all the numerons and often very distinct species of Epilobium found in New Zealand to the common E. tetragonum; and under Styphelia (Epacrideae) he ranged nearly a dozen genera, commonly accepted as distinct.

With regard to honours and distinctions, of which, as we have said, he was inordinately proud, he was what most persons would consider overwhelmed, being a corresponding member of over 150 learned societies, and the recipient of orders and decorations in embarrassing profusion. He was elected a Fellow of the Royal Society in 1861; in 1871 he was created an hereditary Baron by the King of WURFEMBURG; he was one of the first to be appointed to the Order of St. Michael and St. George; in 1879 he was made a Knight Commander of that Order; and in 1888 he was awarded one of the Royal Medals of the Royal Society of London.

We in the mother country can estimate the value of his services to science, and believe that all Australia will join us in saying that he deserved well and highly of his adopted country.

At present we have only telegraphic notice of his death, and do not know how it came about.

DRAWINGS OF MUSHROOM-LIKE FUNGI AT THE BRITISH MUSEUM, CROMWELL ROAD. -A few weeks ago we published a brief notice of the exhibition of coloured horticultural and botanical drawings in the Department of Botany at the British Museum, as arranged by Mr. GEORGE MURRAY, the Keeper of Botany. In our present number, as typical of the season, we are able to give a muchreduced copy of a drawing (one of a series of six), male by Mr. Worthington G. Smith, to illustrate the chief Orders of the larger fungi. The illustration gives typical examples of Mushroom-like funci. The other five drawings in the British Museum, made at the suggestion of Mr. GEORGE MURRAY, give types of Boleti, the woody Polyporese of trees, the Morels, the Puff-balls, the Clavariere, or Club-fungi; an I the Jelly fungi, or Tremellineae. Close by these drawings are nearly fifty others, made by the same draughtsman. In our illustration (fig. 84) the top left-han l fungus is Agaricus mucidns, a white, highly mucilaginous and sticky fungus, frequent on old Beeches: said by some enthusiasts to be edible. The large Agaries on the left represent A. rubescens, another esculent. The two smaller examples close to the left-hand margin belong to the green-blue and poisonous A, irroginosus. The minute white specimens with hair-like stems growing on the dead loaf at the bottom left are A. capillaris. The three Agaries on the top right are the splended glutinous orange-coloured A. adoposus. The three large black fungi on the right are the feetid and poisonous "Magpie Coprinus," C. picaceus. The Agarie in the centre of the drawing is the scarlet-topped and poisonous A. muscarius, and the tall slender-stemmed examiles just beneath are the beautiful yellow-topped A. epipterygius, common on dead bracken. The small fungi growing close together, like a regiment of soldiers, at the bottom right, represent a colony of A. disseminatus, an Agaric common in damp hedgerows at this time of the year, remarkable for its peculiar habit of growing in closely compacted companies.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—It is with much pleasure we make the announcement that Lord Rothschild his kindly expressed his intention to preside at the next festival dinner (58th) in aid of the funds of this admirable charity, to be held on a date to be fixed by his lordship in June, 1897—the month in which the Queen, who has been the gracious patroness of the Institution for so many years, will, if spared, complete the sixtleth year of her reign. We have no doubt that Lord Rothschild will be well and influentially supported on the occasion, and we trust the funds of the charity will be greatly benefited.

BATTERSEA PARK CHRYSANTHEMUM SHOW.—The exhibition of Chrysanthemnus, as we are informed by Mr. Coppin, will be open to the inspection of the public in the frame-yard, at Battersea Park, on Saturday the 17th inst. and for some weeks, from 10 a.m. until dusk,

BRUCE FINDLAY MEMORIAL FUND.—The appeal on behalf of the three daughters of the late Mr. BRUCE FINDLAY, his been liberally responded to in Manchester and elsewhere, the amount already received or promised amounting to £1220, and as the need is great, it is hoped that this sum will be largely increased.

"BOTANICAL MAGAZINE."—The plants figured in the Ostober number are:—

Actually phygraph, Planchon, tab. 7497.—A climbing half-hardy shrub with purplish petioles, oblong, finely strulate, glabrous leaves, and racemes of nodding subglobose flowers, each about $\frac{3}{4}$ inch in diameter. The plant belongs to the Terustromiacee, and is a native of Japan.

Alorasi t revers t, N. E. Brown, in Gardeners' Chronicle, 1890, ii., 35-tab. 7498.

Let'eyeas undulatus, Boissier, tab. 7499.—This is the plant known in gardens as L. Sibthorpii (Baker, in Gurden vs' Chroniele, 1890, ii., 761). It flowers eather than L. rotundifolius, and is smaller than that species. From L. latifolius it differs in its broader leadets, and more numerous flowers.

Fritillaria nobilis, Baker, tab. 7500.—A pretty little Fritillaria, remarkable for its dwarf-habit, and large durk chret-coloured flowers. It was discovered by Sintenis in Armenia, and introduced into cultivation by Herr Max Leichtlin.

Parestin Jacquemontiana, Decaisne, t.b. 7501.—A Himmhyan shrub having, as the eliter remarks, little in common with Parrotia, but more with Fothergilla. It has roundish puckered leaves covered with stellate hairs, and numerous small flowers aggregated in heals surrounded by conspicuous white bracts.

THE DECORATIVE USES OF FLOWERS.—The use of flowers for interior decorations, particularly on obtains of ceremony and festivity, has always been a universal custom among the Japanese, and out of this pastime they have elaborated a method distinctly their own, which, upon examination, reveals asthetic principles of a high order. With the October number of the Stadio, which is the first part of a new volume, will be commenced a series of illustrated articles fully describing, for the first time in any European publication, the wonderfully original methods of flower arrangement adopted in Japan. This number will also contain the first of a series of illustrated articles upon the Arts and Crafts Exhibition at the New Gellery.

THE SURVEYORS' INSTITUTION. — The first ordinary general meeting of the se sion 1896-97 will be held at the temporary address, Savoy Street, Victoria Embankmen', W.C., on Monday, Nov. 9, 18.46, when the President, Mr. Daniel Warner, will deliver an opening a ldress. The chair will be taken at 8 o'clock. Members attending the meeting will enter by the main door of the Medical Examination Hall, fronting the Embankment.

EALING GARDENERS' ASSOCIATION. — An interesting and lengthy paper was read at the meeting of this body of Edding gardeners on October 6, by Mr. A. WRIGHT, gardener at Ealkland Park, Norwood, the subject-matter of which was "The Cattleya-honse, and what may be done with it." The methods of arranging the interior so as to show off the plants in the best manner, and yet secure healthy growing conditions for them: and for securing a moist atmosphere at the smallest expenditure of labour. Cultural details of a general character were also fully dealt with, and the kind of plants notel, which may be allowed in the house at seasons when the Cattleyas have but little bloom upon them.

"FLORILEGIUM HARLEMENSE."—The wish has been repeatedly expressed that the Albam van Eed n, an illustrated work on bulbous plants, published from 1872 to 1881 by the then existing firm, A. C. van Eeden, should be continued. Futteen years passed before the fulfilm not of this desire seemed practicable. When the question cume before the "Algemeene Vereeniging voor Bloembollementhur," there appeared to be insurmountable dufficulties in the way of its being published by that body. Finally, an agreement

was made between the directors of the "Vereeniging" and the Messrs. DE ERVEN LOOSJES, publishers, of Haarlem, whereby the latter undertook the publication under the superintendence of the abovementioned directors. The first number of this new publication, which bears the general title of Florilegium Harlemense, is now ready. It is composed of three coloured plates, with accompanying text in Dutch, English, French and German. The plates are chromo-lithographs from the firm of J. L. GOFFART (formerly G. SEVEREYNS), of Brussels, the well-known specialist for reproducing pictures of flowers and plants. The original drawings were made by Dutch artists. For the following numbers the publishers have secured the co-operation of Mr. A. Goossens of Brussels. Two editors have been chosen by the "Algemeene Verceniging voor Bloembollencultuur." and to these gentlemen is left the selection of the plates, with the understanding that no plate shall appear in the Florilegium Harlemens: until it has received the approval of the directors. This work is not only valuable to bulb-growers and to those in the trade, but should be in the possession of all lovers of plants. The plates are of quarto size, the flowers being represented of their natural dimension, and colour on a dull brown background. The plants figured are single Hyacinth La Grandesse, raised by M. VINCENT VAN DER WINNE about thirty years ago, and which is still considered the best single white for trade purposes, The second plate represents four early Tulips :- 1, Keizerskroon, the oldest early single in cultivation (searlet, bordered with yellow); 2, White Pottebakker; 3, Proserpina, crimson; 4, Vermilion Brilliant. On plate 3 are shown four varieties of Nareissus, viz. maximus, John Horsefield, and albieans. The publication is likely to be very serviceable, as giving representations of the best varieties for cultivation, with details of their history. The illustrations are faithful representations, devoid of exaggeration.

RIPENING OF LILY SEEDS.—LINDEMUTH describes experiments (Ber. d. Deut. Bot. Gesellsch, August, 1896), showing that it is possible to ripen the seeds of Lilinm candidum and of Lachenalia luteola if the fruiting-stalk is cut away from the bulb and laid aside; whereas he states that the seeds do not ripen on the plant. The inference is, that if the stalks are left on the plants, the bulbs withdraw materials down from the fruits, and the seeds cannot be ripened. That the stalks, &c., contain much nutrient substance seems proved by the fact that in Hyacinthus orientalis and Lachenalia luteola they will develop bulbils if cut pieces of them are placed in water. These bulbils do not develop ordinarily, because the excess of material from which they are formed would then pass to the filling bulbs below ground. Now, if this is so, i.e., if the flowering stalks, &c., of plants like Lilies, Hyacinths, Lachenalias, &c., contain important food supplies which go to feed the bulbs, it must be a mistake to cut off the flowering-stems when the flowering is over, under the impression that the bulb is strengthened. And, further, if seeds are prevented from obtaining the stores in the stalks owing to the draught in the filling bulbs, some explanation of difficulties in raising Lily-hybrids may be forthcoming, and more success ensured. It would be interesting to know what raisers have to say.

DYED FLOWERS.—" Button-holes" of a clear lilac colour are being sold in the streets of London which may well puzzle the uninitiated. They resemble, when seen at a distance, Parma Violets or double Hepaticas. A little examination, however, reveals that they are the flower-heads of some white Composite, probably the double-flowered form of Achillea Ptarmica. These have been dipped in some violet dye; at any rate, they have a more natural appearance than the green Carnations once popular, whilst for the majority of button-holers botanical anomalies are matters of indifference.

JUBILEE YEAR OF THE MELBOURNE BOTANIC GARDENS.—The jubilee of the Melbourne Botanic Gardens has been reached, and appropriately celebrated by further improvements. There are

several historic trees in the gardens, some planted by Mr. La TROBE, others by his daughter and by Mr. JOHN ARTHUR, the first Curator of the gardens. A Norfolk Island Pine was planted by Mr. John DALLOCHY, Curator, in 1850; it is now 62 feet high, with a diameter of 2 feet 10 inches at 7 feet from the ground. The islets in the large lake have been recently finished. They will represent tropical islets, with a vegetation chiefly of Palms, which have been transferred from other parts of the garden by the system of transplanting the Director has used with such good effect. lu Mr. Finn's Chronicles of Eurly Melbourne, it is stated that 50 acres of ground were mirked off by Mr. Hoddle at Batman's Hill for a botanic garden in 1842, but were afterwards found to be unsuitable. The present site was then a beautiful valley. From

Fig. No.—Inflores (En) E of MUSA ALOSPERMA. See description by Baron Feddinand von Mueller, p. 300, in our issue for September 26, 1826; also p. 466.)

1836 to 1841 it was a sert of missionary school-ground for the aborigmes, and it was next occupied by the Messas. Hawdon as a slaughtering-place. The Botanic-garden reserve was proclaimed by Mr. La Trobe in February, 1846, on the recommendation of a committee of the City Council; and by May 1, 1847, Mr. John Arthur, the first gardener, had it in excellent condition. Mr. Arthur died in 1849, and was succeeded by Mr. Dallochy. Baron von Mueller (first appointed Government-botanist in 1852) became director in 1857. The management of Mr. W. R. Guilfoyle, who was appointed when Mr. J. J. Casey was Minister of Lands, dates from 1873.

THE UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The annual dinner of this Society was held on October 7 at the Holborn Restaurant, London, when W. J. NUTTING, Esq., officiated as Chairman, being supported by Sir Clarence Smith, Messrs. H. B. May, James H. Veitch,

John Gould Veitch, W. Y. Baker, A. F. Barron, Geo. J. Ingram, and other well-known supporters of this now rapidly-increasing benefit society, which has for its exclusive object the assistance of gardeners during sickness, calamity, and old age. The chairman in a most practical and suggestive manner laid before those assembled the benefits which are afforded to members, urging those present to make its advantages better known. On behalf of the society the Treasurer replied, thanking the chairman for his advocacy of its claims on the horticultural community. Other speakers followed during the evening; amongst the toasts that of "The Press," thanking them for their continued valuable support, was received with enthusiasm. Mr. GEO. GORDON, who replied to the latter toast, alluded to the fact that those who are employed on the horticultural papers, being gardeners, are admitted as members. The present value of the invested funds is £13,700, which, with eash in hand, makes the handsome sum of £14,000. This fact alone should be sufficient to claim the confidence of the entire community, and be the means of many more joining its ranks. Over one hundred sat down to dinner. The Chairman, before the conclusion of the meeting, informed those present that Mr. H. B. May had promised to fill the chair at the next dinner in 1897. The Secretary's address is, Mr. W. Collins, 9, Martindale Road, Balham, London, S.W.

FOREIGN CORRESPONDENCE.

JADOO FIBRE AND VINES.

I HAVE experimented with Jadoo fibre with the greatest care in two different modes :-1st. I grafted some French cuttings on American roots, and made a nursery of 600 plants with Jadoo, and alongside it the same quantity of plants grown in the ordinary way in earth. The Jadoo had no bad effect (as I had thought it might have on the success of the grafting itself, and the shoots at the end of the summer were longer and a deeper green in the Jadoo-nursery than in the adjoining one; the roots were more numerous, stronger, and longer where Jadoo was employed than without it. Without any possible question the employment of Jadoo has given the best results. 2nd. At the end of March last, I replenished the missing plants in the open vineyard with grafted American Vines planted in Jadoo. It is right to say that the roots of these Vines were very badly developed. On September 20 we laid bare the roots of some of these Vines, which had thrown up magnificent shoots, and we were pleased to discover that their roots were developed in Jadoo in a truly extraordinary way; and the result appeared to us as conclusive as that of the other experiment. We intend to make a plantation of young Vines, and use Jadoo about the roots. De Merona, Chidran la Begaree, Margana.

HOME CORRESPONDENCE.

PERNETTYA MUCRONATA, ETC.—As the outdoor flowers become more scarce, the beauties and usefulness of the berry-bearing shrubs become more evident, and where doe thought has been given to the planting of these, as it has in the pretty hill-side gardens of Frank E. Marshall, Esq. Newhands, Harrow on-the-Hill (gr., Mr. Page), the brightly-coloured fruits of the different species of Crategus, of Rosa rugosa, &c, harmonise well with the soft blue tints of the species of Aster, the bright yellow of the autumnal Helianthus, the showy heads of Chrysanthemun uliginosum, and the colours of the few remaining summer and autumn flowers. In one of the large beds a number of good bushes of Pernettya are planted, and these are among the most beautiful objects in the garden, lalen as they are with a profusion of berries, which exhibit great variety in their colours. Here, as in many other gardens, where Pernettyas thrive and berry well, the fact may in a great measure be attributed to their being planted in a situation where there is a good clear light, while at the same time

they are sheltered by other low-growing shrubs. In the same bed Galtonia candicans is flowering for the second time this year; and Andromeda japonica, and other Andromedas are well set for flower. In the plant-houses the Begonias and zonal Pelargoniums are gay; and a neat specimen of Ladia anceps is sending up a good supply of flowers. B.

BUDDLEIA VARIABILIS.—A word of answer to a paragraph in "Kew Notes," in the Gardeners' Chronicle, September 26, p. 362, about Buddleia variabilis. I think the Chinese plant is in cultivation. Lemoine, of Nancy, sold this year under that name a plant which agrees with Mr. Hemsley's description. Marc Micheli.

DELPHINIUM ZALIL D. salphurcum).—My experience with this charming Larkspur is, that it must certainly be called a perennial. We have plants here which have flowered several seasons in succession, forming quite strong tufts of several stems every year. I find it does well in a good loamy soil, either in the herbaceous border or on the rockery. I remember when several years ago it flowered here for the first time, I felt much disappointed with the poorness of flower and its colour and decided to discard it; but seeing it a week later in an Erfurt garden, the plants being there in splendid condition, with flowers of an almost bright yellow colour, I altered my opinion, and we have grown it ever since, classing it among the most desirable of hardy perennials. It seems to do best in summer, with an abundance of sunshine, and preferring rather a dry to a moist soil. G. Reuthe, Tuttenlann.

— Mr. Arnott, on p. 405 of the Gardeners' Chronicle for October 10, has some remarks on this plant, and inclines to think it is an annual. It has proved itself a perennial with me, but a very unsatisfactory one. Early in the season, the leaves became spotted with fungus, and by the time the flowers opened they were nearly all destroyed with it, so that the flowers made a sickly show. If I remember rightly, it was introduced from a dry region of Africa, or Arabia [Afghanistan], and it evidently will not succeed in damp districts, like Dunfries and Rothesay. It is a pity, it being a distinct and beautiful pecies. Muchail Cuthburtson, Rothesay.

ACIDANTHERA BICOLOR.—With regard to the history of this plant, I beg ito state that I received bulbs of it from young Mr. Schimper in 1872; he was then a student at Karlsruhe, and had the bulbs from his father, who was a son-in-law of King Johannes of Tigre. Some bulbs also went to the Grand Duke's gurden, but it flowered first in my garden about 1875 or 1876. It requires a hot summer to ripen well, and to grow its bulbs to size. Max Levelttin, Baden, Baden.

MAIZE, OR INDIAN CORN.—If Mr. Christy will oblige me with some seeds of the variety he refers to, or will let me know where they are to be obtained. I will try them under various conditions, and report the result. As good seeds cannot be ripened with certainty in this climate, it would be necessary to know the correct name and place of origin. I have grown the Zea Curagua 11 feet high, with cobs weighing half a pound each. Thus, Fletcher, Grappenhall, Warrington.

TURNIPS, WHITE AND YELLOW.—I see no reference to the remarks of "D. T. F." in your issue of September 26 ult. in any of your issues subsequent to that date. That his remarks with reference to the varieties of Turnips are perfectly justifiable (it being quite the exception to see any white varieties grown north of the Tweed), is indisputable. It is likewise well known that the Swede is largely cultivated in Scotland for culinary purposes, so that the affinity in colour of the Orange Jelly Turnip and the Swede may have something to do with the favour it receives in the North. Couple this with the matchless superiority of the Orange Jelly as a main-crop variety, and we have, as far as I can gather, the only argument that can be adduced in favour of this variety being chosen by our northern neighbours in preference to such sorts as Chirk Castle, Red Globe, &c. Albert Upstone.

- I for one quite agree with Mr. J. Mayne, on the above subject. Certainly, as an early Turnip, Extra Early Milan should have the first place; and next comes Snowball, which I consider to be the best white Turnip that we have. But for how long a tame will these or any other white Turnip stand in

first-rate condition?—not for very long; therefore, gardeners must grow the varieties, especially where space is limited, which are the best keepers, and I grow Golden Ball. English and French cooks have often told me that yellow Turnips are preferable during autumn, winter, and spring at the best table, because of their superior flavour; and that is also my experience. A. McInnes, Fulkland Palace, N. B.

SWEET PEA CUPID.—The experience gained by cultivators in many parts of the country of the behaviour of this kind of Sweet Pea is, that it is useless for outdoor culture. I sowed some seed in pots early in February, which did fairly well, but the plants did not flower till the first week of May, and the flower-stalks are so short that we could not use them for filling flower-glasses; and thinking to increase the vigour and size of the blooms, I tried a little artificial manure on some, and very shortly afterwards these plants turned quite sickly-looking, and stopped flowering. I also took some of the flowering plants outside, and very soon after removal from the greenhouse no more flowers could be got to expand on them. No more Cupid Sweet Pea for us. Alex. Me Innes. Palace Gardons, Falkland, Fife.

GRAPES AT THE CRYSTAL PALACE.—Your correspondent, "A. D.," p. 436, under the above heading, complains that Gros Maroe was classed with Gros Colmar, and thinks that Gros Colmar is the better Grape. I think that is quite a matter of opinion, for with ns Gros Maroe, in the same house and on the same stock, was a good-flavoure I and useful Grape; whereas Gros Colmar was very poor, so much so, that I cut it out, and I have seen the variety at several places where it has not been a success. The quality and nature of the soil, and special enlture, may, however, make the difference. Our Gros Maroe here is worked on Muscat of Alexandria. A few years since I called upon Mr. Turton at Maiden Erlegh, and he said that his employer, the late Mr. Hargreaves, was fond of Gros Colmar; still, I think that it is a matter of opinion as to which is the better all-round Grape. R. M., Newbarg.

— A correspondent of yours, who prefers Gros Colmar to Gros Maroc, either is gifted with an eccentric palate, or has made a slip of pen. The former is scarcely ever fit te eat, and is perhaps the worst of all the Grapes we grow; but the latter is not far inferior to Black Hamburgh. Vinitor.

A PRECOCIOUS BUSH OF THE WHITE LILAC.—As showing the unusually warm character of the past season, we have a large bush of white Lilac in bloom in the gardens at Beachley. It is an old bush, at present shedding its leaves, and flower-spikes are small. R. Tarnhall, Beachley.

PROGRESS IN THE REIGN OF VICTORIA .- 1 see no reference in your columns to the progress that our profession has made during the long reign of our Queen. Horticulture at the commencement of that period must have been at a very low ebb. Under her wise and successful reign the horticultural profession has done glorious work for the destinies of this great We have only to look at our three 100-feet houses ablaze with bloom of zonal Pelargoniums at the present time, and compare them with those grown by the aid of the old brick-flue Polmaise system of heating of sixty years ago. Greenhouses in those days were simply wooden sheds; now they are nearly all glass, light, and airy, and this artificial arrangement is as nearly consistent with Nature as it is possible to be. How different is the genial warmth we apply at the present time by hot-water pipes hung along and from the roof, and by the utilisation of as much sunlight during winter as can be got. These low, angleshaped structures grow plants immensely better than houses of that period, and which were called "Plant Killers;" to say nothing of the abominably ill-conto say nothing of the abominably ill-constructed fire-place, that was a continual source of hard, black work and annoyance to cultivators. As a proof of how things have improved in floriculture, I sent you flowers of the old—then exclusively called—scarlet Pelargonium Tem Thumb. This now insignificant flower was at that time the pride and glory of every well kept garden, and up to thirty years ago "scarlet Geranium" was the general term, for the "scartet Geramma was the general term, for the simple reason that we had no other colours; now, from this exceedingly bright and brilliant scarlet we have many decided colours, and innumerable intermediate shades and tints-pure white, salmon, pink, orange, and plum, bordering on purple. I have you pips of these, the time gone-by Tom Thumb, and it will be asked, "Is it possible that all these other colours and immense additional size have been bred

and sprung from this?" The answer is "Yes," and he exclamation can be no other than "It's marvellous!" Now let us look at their size; the old favourite measures barely 1 inch across the top petals, whereas some of this year's raised seedlings, which I send you, are over $2\frac{3}{4}$ inches across. The substance of flower sixty years ago, and these had best not be compared for fear that the consequent word of exclamation be questioned. I think flowers have done their part in advancing with the times, and that horticul-turists also have done honour to their Queen and Perhaps no government or country ever did so little as onr's in acknowledging and encouraging the good and all-important work that has been going on during all these many years. Fruit of all kinds has made as much progress. Strawberries, for instance, in those days were Strawberries in name only, poor diminutive fruit tied on straws and so carried about and sold; now we have immensely improved form, size and flavour. I am at this moment writing with a 43-acre field in view, and during the past frniting season I counted twenty special trucks from other companies' lines waiting at our station to be filled with this refreshing fruit, and despatched to nearly every large city and town in the North. To send off 70 tons of this fruit in one day, and from one station, to say nothing of what was carted by road to London during the day and night, must fill everyone with admiration. And nearly all other kinds of fruit have advanced both in quantity and quality at the same ratio. Vegetables: Potates sixty years ago were like Strawberries, nobody knew how to grow them; their nature and constitution had not been entered upon, the result was that only the very inferior ones-hardly good enough for the pigs-were cultivated, and even these were considered a luxury. Whereas, this last spring, in consequence of the improved cropping and disease-resisting qualities, they were so abundant that a farmer (Mr. T. Wood) positively sold 60 tons at 10s, per ton. I have known similar kinds of Potatos sell at £10 to £20 per ton twenty-five years ago. And so I think the whole system of horticulture has done noble things in feeding and making us more comfortable than ever before; so one and all, let us give three hearty cheers for Queen Victoria, may she continue to reign over her millions of subjects for many years to come. H. Cannell, Swanley. [We admire Mr. Cannell's enthusiasm, and sympathise with his patriotism, but we have not done yet. Mr. Cannell has more wonders in store, we doubt not; and the electric light has not yet been adopted in our market gardens, as it will be, and the course of progress has only begun. ED.]

DWARF-GROWING CALLAS.—In your report of the exhibition of the National Chrysanthemum Society, you state that I exhibited Callas of the Little Gem type under distinctive names, the reason for which was not apparent. Had your reporter ever grown many of the Little Gen the reason would have been most apparent, for the simple fact that it is not possible to obtain two or three dozen plants of Little Gem in bloom at this time of the year. The varicties I exhibited are distinct from Little Gem. Devoniensis compared with Little Gem is much earlier, and will produce ten times the quantity of spathes, and is superior in form and substance. The "Godfrey Calla" has also the above-mentioned good qualities, but is double the size of Little Gem. I think if these facts can be proved, I am justly entitled to affix distinctive names. W. J. Godfrey, Enmouth. It would be better if some one else—say the judges—affixed them. Ed.].

NEW INVENTION.

NEW KINDS OF GARDEN OR FORESTRY TOOLS.

UNDER the name of "Sharpington (patent) combined pick and shovel," two tools of this description, a short-handled and a long-handled one, have been sent for our inspection. The long-handled is suitable for emigrants for use in breaking up virginsoil where the pick would be in constant use in loosening stones in the soil and breaking up the subsoil. The short-handled implement is simply a coalminer's pick and spade combined, and we are incompetent to form an opinion of its general usefulness. Some means should be adopted to prevent the point of the pick, when it is laid back on the shaft, running into the hand, as it might do when worn by use.

TREES AND SHRUBS.

CUPRESSUS MACROCARPA LUTEA.

This beautiful Cypress, raised by Messrs. Dicksons, of Chester, is an undoubted acquisition, and the tree when it has acquired age, retains its beautiful yellow tint; the habit is compact, but not so much so as to be formal, and the foliage is finely divided. The word variegated, as applied to this plant, is scarcely correct, the whole of the foliage being suffused with yellow: even the rind of the branchlets harmonises with the general colouring. There is no difference either in shape or arrangement of the leaves between the species and variety, these being short, awlshaped, and loosely imbricated. It makes a good pot-plant. A. D. Webster.

RHUS COTINOIDES.

The Snmachs are famous for the beanty of their autumn colouring, and there is no species that does more to justify their reputation than R. cotinoides. This shrub, in addition to the charm of its beauty, is a plant of great interest as well. The genus Rhus, as now constituted, comprises two groups, one of which is the old genus Cotinns, the other the one to which the Poison Ivy (R. toxicodendron), the Stag's-horn Sumach (R. typhina), and numerous others belong. Of the Cotinus group there are only two species, viz., the well-known Venetian Sumach (Rhus Cotinus), a native of Europe and Asia, and the species under notice, which comes from the Southern United States. It is a very rare shrub, and is said to be found wild only on two or three of the mountains between Northern Alabama and Western Texas. It appears, indeed, to be in process of extinction. As its name implies, it bears much resemblance to its Old World prototype, having larger leaves with a more obovate outline, but of the same smooth, rounded character. I have not seen it flower in this country, but it has the same feathery style of inflorescence as our European plant. Just now, however, it is very noticeable for the rich and glowing beanty of its leaves. They are red, more or less suffused with orange, and give the species a prominent place among the trees and shrubs with beautiful autumn foliage.

LESPEDEZA SIEBOLDI.

The number of autumn-flowering shrubs is so limited that every one with any pretensions to beauty has a claim to be brought into notice. Such a claim has this Lespedeza - a leguminiferous shrub, introduced from Japan by Siebold, but a native also of China. It is seen at its best during a warm September and October, such as that of 1895, and the very reverse of what we have this year experienced. In spite of these recent adverse conditions, it has managed to give a pretty display, the beanty of the flowers being much enhanced by the graceful habit of the shruh. It dies down to the stool each year, but sends up slender shoots during the summer 6 feet long. The flowers are borne at and near the ends of the shoots a slender panicle springing from the axil of each leaf, and the whole forming a large branching raceme 2 feet long. The flowers are of a rosy-purple colour. The plant is of easy culture, thriving in any soil that is fairly rich and moist. The old stools ought to be divided at intervals of every few years, the result being a more vigorous growth and blossoming. The species is known also as Desmodium penduliflorum, and erroneously as Lespedeza bicolor, which is a very different. earlier-flowering shrub, of dwarfer habit.

THE HONEY LOCUST (GLEDITSCHIA TRIACANTHOS).

Although a perfectly hardy tree in Britain, this does not acquire the same striking character that it does in sunnier climates. In the south of France, especially about Hyères, it can be seen growing in hedgerows, and at this season presenting a remarkable appearance, by reason of the great number of large, broad, twisted pods that hang loosely on the trees, and rattle with every breeze. It has flowered and fruited this year in the Sonth of England, and might possibly have ripened seeds had the last month or

six weeks been more sunny. The flowers are green and inconspicuous. The tree is worth growing for the bright yellow colour its foliage turns in September. A good-sized tree, not far from the Palm-house at Kew, is a most conspicuous feature every autumn, especially on bright mornings or afternoons when the low, almost level rays of the sun light up the foliage into a brilliant mass of vivid yellow. The spines with which the tree is so formidably armed, are not so strikingly developed as in the hot Mediterranean country, where they stand out from the stems stiff and sharp as bayonets, and branching. But even in this country, it would have to be a serious peril one would elect to escape from by climbing the Honey Locust.

CRATEGUS PUNCTATA.

Among the many Thorns which this autumn have beautified our gardens by their abundant fruits, few have been more striking than this American species. It has an obovate leaf, the blade sending down two narrow wings almost to the base of the petiole; it is 2 inches to 4 inches long, irregularly toothed, except at the base, smooth, and dark green on the upper surface, paler and pubescent below. The wood is light-coloured, and occasionally armed with stout, straight spines 1½ inches long, which become branched on the older wood. The flowers appear in May and June in broad, flat corymbs, each flower being 3 inch across, and pure white. The fruit is one of the largest of all the Haws, measuring close upon I inch across; it is almost globular, and the calvx. with its five narrow-pointed sepals, still adheres at the top. In the ordinary form the fruits are red when ripe; in the variety aurea they are bright yellow; and in the variety brevispina they are of a dark, dull purplish-red. In almost every case they are sparsely dotted, a character to which the name refers. The species is a small tree, and was introduced in 1746; it is one of the most desirable of American Thorns. 11. J. B.

RAMIE AND CHINA GRASS.

Ramie and China Grass are the commercial names for two varieties of an Indian nettle-like plant, Bechmeria nivea, and its variety tenacissima. Generally, however, the term Ramie is applied indiscriminately to both. These two plants are the source of a fibre which for strength, fineness, and lustre, is preeminent among vegetable fibres, and is said to be inferior only to silk. They are easily cultivated, very prolific in fibre-yielding stems, and easily manipulated. They are abundant, either wild or cultivated, in various parts of India, Malaya, China, Japan, &c. Under cultivation in this country one of them yields annually at the rate of twenty stems per square yard, and they are as easy to cut, bind, and handle, as Osiers.

But no means of extracting the fibre so as to make it pay have yet been revealed, although prizes and rewards have been offered by the Indian, French, and other governments, for a machine or process that would separate the fibre from the stem and bark cheaply and expeditiously. Experiments have been going on for the last twenty-five years, and capitalists have been impatiently waiting, money in hand one might say, for the right invention to make Ramie a promising speculation. China Grass may be successfully grown in this country, as is shown by its behaviour at Kew, and it has been suggested that the cultivation of this plant might be profitably undertaken in the south of Ireland.

The demand made upon Kew for a supply of fresh stems for experimental purposes has led to the cultivation of China Grass on a somewhat extensive scale there, about a hundred square yards being planted with it. The average yield is at the rate of twenty stems per yard, the height of the stems being from 5 to 6 feet. These are developed in about four months, and are at their best in September.

China Grass (Bochmeria nivea) has a root stock formed of interlacing, somewhat fleshy rhizomes, up to half an inch in thickness. To test the value of these for purposes of propagation, about one hundred pieces an inch long were planted in the spring in a

cocoa-nut fibre bed in a warm-house. In ten days from the time of planting, they had each developed numerous shoots 2 inches long. Some of these rootcuttings were grown on and planted outside in June, where they formed large plants, producing about six good stems each by September. From this it is evident that to work up an nolimited supply of plants is merely the work of a few weeks. The quarter upon which the bulk of this plant is grown having become poor, the plants were lifted early in the year, cnt up with a spade into clumps from 6 inches to a foot through, and replanted 2 feet apart after the soil had been broken up and manured. quarter there is now a fine crop of stems, which were ripe for cutting in September, and a second crop of yonog stems has already reached a height of 2 feet. Evidently, therefore, had the first crop of stems been cut as soon as they were ready, a second crop, almost equal to the first, might have been got in one year. Some of the stems grown this year have been tested. Twenty green stems with leaves removed weighed 4 lb.; these yielded 14 lb. of wet ribbons (filasse), and this, when dry, weighed 5 oz. From this it is roughly calculated that 1 acre would yield about 2 tons of dry filasse per crop.

This plant is quite hardy at Kew. The stems are annual, perishing with the first severe frost.

Ramie (B. nivea var. tenacissima) differs from the type in having distinctly cordate not cuneate leaves, and in their being green on both sides, the leaves of the type being silvery beneath. It also differs in being less hardy, plants placed ont-of-doors under favourable conditions this year having produced stems only 2 feet high, whilst the leaves suffered with the first chill. In a hot-house the stems have grown to a length of 4 feet. The green fibre from the plants grown at Kew is much stronger in China-grass than in Ramie. They are both equally prolific of fleshy roots and stems, and they may be propagated with equal facility from root-cuttings. In this country the green form (Ramie) is practically worthless. It should be borne in mind that the term Ramie is applied to the hardier and more valuable form. If: IF.

SOCIETIES.

ROYAL HORTICULTURAL.

(Concluded from p. 48).

THIRD DAY'S CONFERENCE.

GATHERING, STORING, AND PROFITABLE UTILI-SATION OF APPLES AND PEARS.

Mr. Philip Crowley, F.L.S., Treasurer of the Royal Horticultural Society, and Chairman of the Fruit Committee presided on this occasion.

Mr John Watkins of Hereford read a paper on "Gather-102, Storing, and the Profitable Utilisation of Apples and Pears." He said that anyone looking round the grand collections of fruit at that show, must be struck by the fact that our growers could produce as good fruit as anyone in the world. Why then had the foreigner captured our mirkets? We could grow the fruit, but that was only one part of the business of fruit-growing for a profit. He had known many excellent growers fail to make both ends meet from ignorance on the best method of harvesting and turning their fruit into money.

The time of gathering Apples depended to a great extent, upon the variety, the season, and the state of the market; but, as a rule, most large, early, soft-fleshed Apples, such as Ecklinville Seedling, Lord Sutheld, and others of the same class, should be gathered early, before they were fully ripe. They would then travel much better. Early dessert Apples, on the other hand, were generally best left on the trees until fully ripe. They then developed their best flavour and colour. Both should be marketed as quickly as possible, as it was wonderful how soon the early Apples lost their freshness, and therefore their marketable value, after being gathered. If there were heavy crops, it was a good plan to thin the truit very considerably—even to the extent of half the crop—before they were nearly fully grown, and to market those picked. It was more than probable that the remaining crop would develop so much better, and more profit would be made, with less strain on the trees. To make fruit growing a commercial success, crops and home markets had not only to be studied, but also the reports of crops and markets abound. If Apples were selling well, and there was a prospect of heavy importations from abroad, the fruit should be gathered early, and marketed with the early sorts; but if English crops were heavy, and there was no fear of large importations, the mal-season Apples should be allowed to remain on the trees to fully colour and mature. They would then keep longer for later markets, and be more attractive when sold, if carefully packed. Last year, the general quality of the American and Canadian fruit was not good, ourseprently, when the glut of fruit was over, the English grower who kept his fruit well, was rewarded by a large advance in price. This year, how,

ever, there was a prospect of heavy importations of good frint, and he would advise growers to market early, and keep only their best late-keeping sorts. It was stated that Canada alone would export I,500,000 barrels. The general opinion was that Apples should be perfectly dry when picked, but was that Apples should be perfectly dry with packet, our from his own long experience, he had never found any harm done to the Apples for market purposes, if picked when a little damp, provided that they were not very wet and stored so thickly as to heat indeed in many cases they had kept fresher and plumper, though, perhaps, at the expense of their best flavour if used for dessert.

Pears did not require quite the same treatment in gathering as Apples. Early Pears should always be gathered for market before fully ripe. Late Pears, like Late Apples, should be left to fully mature on the trees, or they did not

ripen or keep well.

As to the mode of gathering Apples and Pears, this could not be done too carefully. All fruit should be carefully placed in the basket, which should have a swing handle, and be fined or publich. Fruit should never be dropped into the basket, but placed there by the hand. Choice specimens of Apples and Pears should be placed in very shallow baskets. Large crops of commoner fruit should be allowed to gently rell out of the basket. Fruit could not be too carefully handled, a thing could be more harmful to fruit than the plan adopted by some pickers, who slung a bay round their bodies and dropped the fruit into it.

To in the the most money of fruit it would sometimes have As to the mode of gathering Apples and Pears, this could

To in the the most money of fruit it would sometimes have to be stored probably for some months, and upon the con-struction of the store-room depended to a great extent the condition and market value of the fruit. For high class or specimen for taproperly-constructed fruit room with shelves, was necessary. This need not be an expensive structure, was necessary. This need not be an expensive structure, but it should be built so that a low and uniform temperature could be muntained. It should be quite free from draughts, but capable of being ventilated when necessary. Apples required good ventilation for the first three weeks or a month after being gathered, but after this time, the more mount after remy gatheren, one are the roller to have securely they are kept from the air and draught, the better they would keep. Apples, too, were best kept from the light, and darkness did not interiere with their colouring after being stored. The fruit room should be frost proof kept best just above, but never below, freezing point. The rooms should have double walls, and double windows and doors. The frost would not pass between two such walls even if thin, as the air between effectually prevented it, but even it thin, as the air between ence many prevented it, but the inner wall should not touch the outer wall, as the frost would enter at that point. He had often had specimen fruit from two seasons in such a room at the same time, and c all lalways make a fair display at the Royal Agricultural e oil I always make a fair display at the Royal Agricational Society's show, which was held in Jone. Large quantities of fruit would keep well if hald on the floor 12 or 18 inches deep, and covered up from the light. Should frost enter, the fruit affected should not be touched until the frost hal disappeared. The loss from frost would thereby be greatly lessened. The less an Apple was handled after being picked the better it would keep, and he found no necessity for following the old fashioned method of frequently wiping the finit to remove the moisture. Pears, on the contrary, raquired a rather higher and drier atmosphere than Apples

He next turned to the all-important step in fruit-growing—the marketing and profitable utilisation of the fruit. Dafferent markets had to be studied, and the classes of truit they solt best ascertained. Some markets disposed most readily of large cooking Apples, another market preferred high colour to quality, and it was no use sen lang common fruit to Covent Garden Market; but there were markets which would take it. Large coarse sorts of Apples, such as Cat's heads, would not sell in Lon Ion, but they would do so in Wales and the North. The grand Cox's Orange Pippin would make a high price in London, but it would not do nearly so well in Wykin Pappin, a high-flavoured but not very attractive looking dessert Apple, would sell well in Birmingham, but buyers in other parts of the country would

not look at it.

Everything, however, turned on the way in which they did their grading, and they could depend upon it that the inture of the English fruit trade depended upon that most important of cration. Other countries surpassed us only by the fact that they understood the art of sending their fruit to market in an attractive condition, and by sending to this country only their lest. Of course, no grower could grow all best, and there were markets for the seconds and thirds, as well as for the very choicest. If, however, all these were sold ungraded they would letch but a third rate price for the lot, wherea they were properly guided, the best would make the best price in the market for the high-class fruit, the seconds would make their value, and the thirds could be utilised for some other purpose. There should also be a fourth grade for extra selected choice specimens, which would fetch the highest price for special occasions and decorative purposes. In September he had sold by public anction, at Hereford, Apples (Peasgood's Nonsiel) at 4s, 6d, to 5s, per box of one dozen and that to dealers; whereas plenty of common fruit sold at the same sum per hundredweight. The thirds could be very profitably disposed of to jammakers; and the smalls were suitable for eider, although he warned them that sharp, sour cooking Apples would not make good cider. Rich, sweet, and highly-flavoured Apples made good cider; but the best dessert Apples were worth too much money to be utilised for eider, and it would be folly to much money to be fittlesed for enery, and it would be made from use them when as good, or better, cider could be made from less costly fruit. Large fine fruit from young trees did not make as good cider as smaller fruit from old trees. If the thirds could not be utilised for any of these purposes, they should not besitate to throw them away, rather than mix

them with the better class-that was, if t'ey had no pigs or other stock r quaing to be fed. It would pay them better. Pears should be raded in the same way as Apples.

Then the greatest care and discrimination should be exercised in the packing. Different sorts should never go in the same package. The best grades should be brunded, and whatever the puckage, it should be packed fairly, but as attractively as possible. Inferior fruit should not be covered over by good fruit, but the fruit should be of the same class I iferior fruit should not be covered throughout. T is guined the confidence of buyers and the public. The English packer was gaining wisdom in this respect, and as home grown Apples were more in demand than they were some years back, it was for ourselves to say whether that demand should or should not be maintained and increased.

The Rev. P. CLEMENTI-SMITH, F.R H.S., said he had had some experience in packing, and he received fruit from his friends in Como, Quebec. He rather took exception to forcing Apples into barrels. The way they did it in Canada was to loosen the rings of the barrel until it was full, and then tighten the rings. Apples should not have any "play." There was a feeling, however, in Canada that the burrel system was not altogether successful. He personally preferred the Australian system of oblong or square boxes.

Mr. Royfell, (Streatham Hill) said last year he had

Mr. ROUPEL (Streatham Hill) said last year he had a few tons of Apples sent up from one of the fruit districts, and he particularly requested that care should be taken in packing the fruit. The fruiterers sent in large brurels, containing about 112 lb. The barrels were lined with a thick sponzy paper, and on the top there was a pad of paper with some straw, a wicker cover being drawn fightly over the whole with strings. The Apples arrived in capital condition, and the only objection to the wicker top was that it was rather a temptation to the railway men to open the barrels and occasion dly test the quality of the fruit. Some of the finest truit was very imquality of the fruit. Some of the finest fruit was very impatient of bruises. There was even a difference in that respect between American, Australian, and English Apples. He tancied English Apples were more juicy and more impatient. of bruises than the others. The Blenhein Orange was a favourite Apple, and there was an almost unlimited demand for it in London. There was hope for all who would take the trouble to grade properly. With reference to the storing of fruit, Mr. Watkins bad stated that it was better to err on the side of dampness rather than dryness. He wished Mr. Watkins had been more emphatic on that subject. Generally speaking, gardeners kept their fruit a great deal too dry, and when it was sent into the house it was often shrivelled. He remembered when a house it was often sprivelied. He remembered water a boy feeling for Apples in the long grass, and he found some Mannington Pearmains in excellent condition, although they had lain in the snow. Some varieties would burst with the frost, but Cox's Orange Pippin, Sturmer Pippin, and Mannington Pearmain would stand several degrees of frost without injury. Washington and American Mother would stand the frost very well; but still it was important to keep the frost out. If, however, that could not be done, they should not despair, and if they only refrained from himiling the fruit, their less from frost would be inconsiderable.

Mr. F. B. PAREITT Reading) asked whether Apples packed by the dozen in eard board boxes would find a market in London.

Mr. WATKINS replied that such boxes might find a ready sale among private consumers. He did not think smaller quantities than two or three dozen would pay for market

purp is 8. A hearty vote of thanks was hen see reed to Mr. Watkins for his paper, and the proceedings ended.

October 13, -A meeting of the C manittees of this Society was held in the Drill Hall, James Street, Westminster, on Tuesday last In most respects the display was more than copial to our expectations, the hall being fairly well filled with miscell meons exhibits. The absence of Chrysanthemums in any quantity, again formed a subject of remark, and it is evident that collections generally are very late. It is seldom that two Gold Medals are awarded to exhibits at one meeting, but on this occasion the Orchid Committee recommended this highest honour to a magnificent plant of Vanda Sanderiana, from J. GURNEY FOWLER, Esq.; and the Fruit Committee made a like award to a very representative collection of garden produce, consisting of most kinds of fruits and vegetables, from Mrs. WINGWIELD. The weather was exceptionally cold, but nevertheless there were many choice species of plants staged, including a group of Adiantum tenerum var Farleyense, and a considerable number of Orchids. The collections of Dablia blooms, and out-of-door Roses, are probably the last of the kind we shall see exhibited this season

Floral Committee.

Present: W. Murshall, Esq., Chairman; and Messrs. Jno. Fraser, H. B. May, H. Herbst, R. Dean, Robt, Owen, Geo Stevens, J. F. McLeod, J. H. Fitt, R. B. Lowe, C. J. Salter, W. Bain, J. D. Pawle, Geo. Nicholson, Chas, E. Shea, J. W. Barr, George Gordon, J. T. Bennett-Poe, Geo. Paul, C. Beckett, Chas Jeffries, H. H. D'Ombrain, H. Turner, Ed. Mawley, C. T. Druery, Jno. Laing, R. M. Hogg, and J.

A collection of Michaelmas Daisies, shown by Mr. J. Hubson, Gunnerbury House Gardens, Acton, Middlesex, con-

sisted of a number of plants in flower in 5-inch pots. Many varieties were noticed, and the plants bore a profusion of The plants were obtained from cuttings which were inserted in a cold frame on May 30 last (Bronze Flora Medal).

A group of plants of Adiantum Farleyense, from Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton, exhibited this handsome species of Fern in capital condition. A few plants of the excellent winter-flowering Begonia Gloire de Lorraine hidden by blossoms, were from the same nursery also (Silver Banksian Medal)

Messrs, Young & Dobinson, Stevenage, Herts, made an exhibit of sprays of Michaelmas Daisies, and other hardy species of flowers.

Messrs, H. CANNELL & Sons, Swanley, Kent, exhibited a few sprays of Cannas in variety, including such capital varieties as Queen Charlotte, Ed. Meig, Schateur Montefiore, Cart. P. de Suzzoni, yellow, with faint marks; Dr. Vergely, and Beauté Pottevine, an intense, self-coloure t

Messrs, J. Cheal & Sons, Lowfield Nurseries, Crawley, made a large and—considering the cold—a surprising dishade a large and—considering the cold—a surprising dis-play with Dahlia b'ooms. Decorative Cactus and single blossoms were well represented, and three Awards of Merit were obtained. The varieties so honoured were Mrs. Kingsley Foster, a fine Cactus-shaped flower of amber colour; Miss Kathleen Goschen, a single flower of good form, centre of petal white, and margins deep erimson; and Miss Hulson, also single, with rose-coloured petals, the centre of which is partially white (Silver Flora Medal).

Messrs, Jas, Verren & Sons, King's Road, Chelsea, exhibited some plants in flower of Amasonia punicea, and a number of sprays of their hybrid greenhouse varieties of Rhododendrons.

Mr. Tuos S Ware Hale Farm Nurseries, near Tottenham, made an extensive display with cut flowers, including earlyflowering Chrysanthennums, a few Michaelmas Dahlias, &c. Mr. Wake also exhibited a few Nerines in flower, including a seedling variety named Novelty. The flowers are large, in a rather loose umbel; they are rose coloured, the petals are long an 1 only slightly recurved, and the flower is very dis-tinct. A Bronze Banksian Medal was awarded the group.

The best exhibit of Chrysonthemums was from Wells, Earlswood Nurseries, Redhill, Surrey. The new variety, Madame Gustave Henry, was shown in several in-stances, and a plant containing two blooms also. An Award of Merit was recommended, and it will be remembered that at the National Chrysanthemum Society's Show the variety was given a First-class Certificate.

Mr Wells had twenty-four large blooms of different varieties, including Graphic, Thomas Wilkinson, Reine d'Angleterre, Hairy Wonder, Malame C. Champon, Ernest Fierens, Surprise, &c.

Messrs, FRANK CANT & Co., Braiswick Nursery, Colchester, exhibited a group of flowers of late blooming Roses. These bunches of blooms, cut with pleuty of foliage, were very attractive, and were unusually good for so late a date (Bronze Banksian Medal).

Mr. Geo. Prince, nurseryman, Oxford, showed some Tea Roses in glasses, arranged upon a half pyramid with narrow shelves which were covered with black velvet (Silver Banksian Medab.

Mr. Willard, gr. to the Baroness Bundett-Courts, Holly Lodge, Highgate, exhibited some plants of a variegated sport from Begonia metallica. The variegation is distinct and good, and the variety is to be known as B. M. Regina (Award of Merit).

Mr. C. TURNER, Royal Nurseries, Slough, exhibited a few Iddlia blooms, and Awards of Merit were made to Ophelia, a finely-shaped Cactus bloom of bright cerise colour; to Clarissa, a pretty pale yellow Pompon; and to Geraldine, one of the tinted Pompous, the prevailing tints in which are rose and

Mr. R. Owen, Maidenhead, exhibited blooms of a New Seedling Chrysanthenum, named Lady Grey, a Japanese, reflexed, with white and fairly broad florets; and of Golden

Sheaf, apparently most useful for decorative purposes. From Mr. W. F. Rosoman, The Nurseries, Sholing, 1 was exhibited blooms of Chrysanthemum Reanty of Sholing, a variety of some merit.

Flowers of vari ties of Nerines were sent by Mr. F. W. MOORE, Botamic Gardens, Glasnevin, Dublin; and by Mr. J. L. Mansell, Guernsey.

Messes, Jas. Veire n & Sons, Royal Exotic Nursery, Chel-sea, were awarded a First-class Certificate for Aglaonema Curtisii. The leaf-blades of this handsome plant are about 10 inches long and 3 inches wide, and the stalk 6 inches long. They are green, with white bands running diagonally across the leaf

Mr. H B. MAY, Dyson's Lane Nursery, Edmonton, showed a handsome new Asplenium, named A. Herbstii. The plant was apparently a young one, the fronds very foliaceous, and a bright olive green colour (Award of Merit.

An Award of Merit was also recommended to Lobelia Gerardi, a variety with moderate-sized blue flowers; and to Salvin salvadous grandiflars with lowers and bandsome

Salvia splendens grandiflora, with larger, and handsomer flowers than the type, both from Sir Trevor Lawrence.

A First class Certificate was awarded to Pteris Childsii, a plant of which was exhibited by Mr. T. Childs, New Eltham, It has compound fronds with much subdivided pinnie. tips and margins of the fronds being very prettily tasselled or percristate.

ANTHONY WATERER, Knap Hill Nurseries, Woking, exhibited several specimens of the Scarlet-leaved Oak

A first-rate collection of Asters or Michaelmas Daisies was contributed by Mr. Beckett, gr. to the Rt. Hon. H. H. ALDENHAM. Aldenham Park, Elstree. Varieties of a large

number of types were well represented, and a Silver-gilt

Banksi in Medal was deservedly awarded.

Messrs Barr & Sons, King Street, Covent Garden, made a display consisting of out-of-door Chrysanthemuns, several species of Lilies, also Aconitum antunnale, Astrantia major, Michaelmas Duisies, &c. (Bronze Flora Medal).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien Hon. Sec.), T. B. Haywood, Sydney Courtauld, J. Gurney Fowler, Thos, Statter, Elijah Ashworth, H. Ballantine, H. M. Pollett, W. Cobb, De B. Crawshay, H. J. Chapman, W. H. White, J. Jaques, E. Hill, and T. W.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr., Mr. Bavis) exhibited a magnificent specimen of Vanda Sanderiana, which might well to described as a great bush, tearing many grand flower-spikes with an aggregate of 127 flowers-one of the very finest specimen Orchids ever seen. The plant had recently 137 blooms, but one spike has passed. For excellence of culture and profusion of flower, a Gold Medal was awarded.

Messrs, Jas. Veiten & Soxs, Royal Evotic Nursery, King's Road, Chelsea, had a tastefully-arranged group of rare Orchids. Their novelties were three in number, by far the best being Cattleya × Apollo (C. Mossie 9, C. Aclandie 3), a hybrid of quite new features. The fine flowers, which were nearly as large as those of C. Mossie, more resembled in form and in their firm substance those of C. Aclandia. The sepals and in their firm substitute those of C. Accadena. The sepals and petals, which are well displayed, are of a peculiar buff-pink colour, lightly veined with rose, and with some distinct purple markings irregularly displayed. The broad scoop-shaped lip is bright crimson purple in front, with yellow markings in the centre; the side lobes being blushwhite, edged with rose—a very striking flower (First-class Certificate). Another pretty new hybrid was Ledia × Clarinda (L. Perrini Q, L. pumila &), a neat flower, with pale inda (L. Ferrim Y, L. pinnia 3), a next hower, with pale purple-tinted sepals and petals, and intense dark purple-maroon front and veining to the lip; and Cattleya. Minucia (Loddigesii 9, Warseewiezii 3) with delicately-tinted flowers, has improved, its prettily shaped cream-white, yellow and rose labellum being a very attractive and distinct feature. In Messrs, Verreu's group were good examples of Cattleya

× Wendlandii (Bowringiana × Warscewiczii); C. × Mantinii (Bowringiana × Dowiana) L.-C. × Nysa, L.-C. × Eunomia, × Wendlandin (Bowringiana × Warseewiczii); C. × Mantinii (Bowringiana × Dowiana) L.-C. × Nysa, L.-C. × Eunomia, Cattleya × porphyrophlebia, the elegant little Coclogyne Veitchii, with its drooping sprays of white flowers spirally arranged; Cypripedium × Milo, C. × T. B. Haywood and many other Cypripediums; Peristeria elata, several fine Cattleya Dowiana aurea and C. labiata, and many other rare species. The group was awarded a Silver Flora Medal.

Thos. Statter, Esq., Stand Hall, Whitefield, Manchester Thus, Statter, Esq., Stand Iran, Whiteheld, Manchester (gr., Mr. R. Johnson), again showed the noble white Cattleya Warscewiczii "Countess of Derby," which had previously received a First-class Certificate. On this occasion a Silver Flora Medal was voted. Mr. Statter also showed Cattleya bicolor corulea, with slate-blue lip; and C. > Prince of Walso. Wales.

ELLIAH ASHWORTH, Esq., Harefield Hall, Wilmslow, Cheshire, showed the beautiful Cattleya labata autumnalis "Mrs. E. Ashworth," with pure white sepals and petals The lip was marked in the front with bright purple, and margined with white (First-class Certificate).

Cattleya Dowina, Wheatley's variety, sent by F. Wheatley, Esq., Devon, afforded a similar case of suppreswhere, esq. bevon, anorted a similar case of suppression of the colour of the sepals and petals as that in Mr. Ashworff's C. labiata. The sepals and petals were white, with the faintest trace of yellow, the lip being that of a good C. Dowiana aurea (First-class Certificate).

C. L. N. Ingram, Esq., Elstead House, Goddming (gr., Mr. T. W. Bond), staged a small group of very fine hybrid Orchids, for which a Silver Banksian Medal was awarded. Of them Cattleya \times Triumph (C. Luddemanniana \times Lawrenceana) was a charming plant, with flowers of one uniform renceanal was a charming plant, with nowers of one uniform lilac tint, and with a slight purple marking on the lip. It resembled C. Lawrenceana, conceder in tint (First-class Certificate). Cettleya × Eclipse (C. maxima × Skimeri), was a very distinct hybrid, with much resemblance to C. maxima, but with a more trumpet-shaped lip (Award of Merit.) C. × Jupiter (Lawrenceana × Warscewiczii var.) was a very pretty hybrid, resembling a light form of C. Luddemanmana (Award of Merit); Lelio-Cattleya × T. W. Bond (C. lahiata autumnalis × L. purpurata), resembled L.-C. × Eximia, but the autumnal labiata wrought a change in the time of flowering; L.-C. Firefly (L. Dormaniana x C. Bowringiana) was a singular little rose-purple flower and the L.-C. × (C. bicolor × L.-C. × elegans), was a pale form of L.-C. × Andreana, previously shown.

Messrs. Hean Low & Co., Clapton, staged a good group, in which the central figure was Cypripedium Charlesworthii, Lowe's variety, a grand and massive flower, good in every respect, and by many thought worthy of a higher award than the Award of Merit accorded. The dorsal sepal was 3½ inches across, and perfectly flat. In Messrs. Low's group also were Cattleya × porphyrophlebia (intermedia × superba); several fine C. Ibwiana aurea and C. labiata; Oncidium ornithorhynchum album, Cypripedium × Madame Georges Truffaut, C. × James Buckingham (Enfieldientse × bellatulum), C. insigne Lutwychei, C. × Chas. Canham,

Cyenoches chlorochilon, &c. (Silver Banksian Medal).

Messrs, B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N., staged a group, in the centre of which was a fine plant of Arachmanthe Lowii. With it were Vanda tricolor superba, Cattleya × blesensis, C. labiata varieties, Dendrobium Phalenopsis Schroderianum, Cypri-

pedium Adonis pictum, a very neat and pretty flower; C. X Arthurianum, C. tonsum, C. insigne Wallacei, C. & Pitcherianum Williams' v.ar C. & Crossianum, Collogyne Massangeana, Cochlioda vulcanici var. grandiflora, Oncidium ornithorhynchum album, O. Forbesii, &c. (Silver Banksian Medal).

Messrs, Sander & Co., St. Albans, had a cry effective group, in which were Ladia pumila delicata, a nearly white form; four plants of the singular Habenaria Susanua-Odontoglossum grande, a fine specimen of Dendrobium odontogossam grande, a nne specimen o bendemada aureum, Vanda coerulea, Cypripedium × Fairy Queen (Curtisii × Druryii), C. > McNabianum (callosum · con-color), resembling a pule C. - Marshallianum; C. × Alcides, C. × Uihleinianum, C. > Maynardii, C. × nobilior, Callotthe vestita Sander's var, Codogyne Swaniana, Oncidium Krameri, and a singulur little greenish Epidendrum named profusum (Silver Banksian Modd).

A cultural communication was given to J. C. RAMIGLES, A cultural commenciation was given to 0. C. Avoness, Es₁, J.P., Willinghurst, Shamley Green, Guildford (gr., Mr. A. Nash), for a splendidly-grown plant of a very fine variety of Vanda corrules, with two spikes, bearing together twenty-five flowers.

A. H. SMEE, Esq., The Grange, Carshalton (gr., Mr. Cummins), showed the beautiful little Comparetta speciesa, with three spikes of its showy light orange flowers (Award of Merit).

T. W. SWINBURNE, Esq., Wincheombe, showed a good Cypripedium Charlesworthii.

D: B. Crawstay, Esq., Rosefiel d. Sevenoaks gr., Mr. S. Cooke), again exhibited Odomoglosum Uro-Skinneri album, the extraordinary form raised from seeds, and which have produced idants in which the colouring of the lip is entirely

G. SHERLAND BALL, Esq., Ashford, Wilmslow, Cheshire (gr., Mr. A. Hay, sent a fine flower of Cypripedium insigne Sanderse

Fruit Committee.

Present: Philip Crowley, Es I. (chairman), and Messrs. Geo. Bunyard, H. J. Pearson, Jos. Cheal, G. W. Cummins, A. F. Barron, A. H. Pearson, J. Wright, Alex. Dean, H. W. Ward, W. Pope, W. Farr, Chis. Ross, G. Wythes, Jas. H. Veitch, H. Balderson, and Geo. T. Miles.

An extensive collection of trusts and vegetables was shown from the gardens of Mrs. WING FIELD, Ampthill (gr., Mr. W. J. Empson). Black Hamburgh and Golden Queen Grapes wers very good; Apples and Pears were present in numerous varieties, and Gourds of differing form, colour, and size added to the attractiveness of the exhibit. A few Plums, Bunsons, Walnuts, Coleouts, Mellars, Oranges, Melons, excellent Tomatos, Quinces, Capsicums, and Cucumbers were noticed. Of vegetables there were many meritorious varieties including Cauliflowers in several varieties, large Carrots, Parsnips, good Leeks, excellent Ailsa Craig and Holborn Model Onions, Turmps, Kohl Rabi, Beet, Standard Bearer Celery, Carter's Little Prize, and Carter's Early York Cabbage, Ne Plus Ultra and Jubilee Beans; also Kale, Lettuce, and a number of varieties of Potatos were all included in this most representative exhibit of garden produce. A Gold Medal was deservedly awarded to this

One hundred dishes of Apples and Pears were included in a commendable exhibit from Mr Geo. Wythes, gr. to Earl Perev, Syon House, Brentford, which was displayed over white I save paper, and Ampelopsis leaves and bunches of berries were strewn between the dishes. Some little groups of Apples and Pears, exhibited upon partially-coloured Vine leaves, were more pleasing in effect than others in the usual plates. Many of the Apples exhibited a onsiderable amount of colour, and Bearre Diel and other Pears were good (Silver-

gilt Knightian Medal).

The best Pear before the committee in the Veitchian competition was Doyenné du Comice, shown by Mr. C. Herrin, Dropmore Gardens. They were from a bush-tree on the Quince, in an open situation. The 2nd prize was taken by a dish of Thompson's, shown by Col. BRYMER, M.P. These were from a tree upon a west wall upon light soil in Dorsetshire

The 1st prize for Apples was given to Cox's Orange Pippin, from Mr. Gro. Wynnes, Syon House Gardens, from pyramid trees, four to six years old, on the Paradise stock; 2nd, Ribston Pippin, from Orchard standard trees, shown by Mr. C. HERRIN.

Mr. Jas. Rubson, Gunnersbury House Gardens, showed a basket of first class fruits of Newton Wonder Apple from dwarf trees on Paradise stock, planted on grass-land in November, 1894 (Cultural Commendation).

Mr. Hubson had also dishes of six varieties of Peas, the pods being capitally filled. They were Sutton's Bountiful, sown on July 20; Criterion, sown on July 7; Sutton's A1. sown on July 20; Empress of India, July 10; William 1. July 20; and The Duchess, July 7; Cultural Commendation.

Mr. J. Harris, Waddon House Gardens, Croydon, exhibited

a Seedling Melon named Harris' Favourite, a scarlet-fleshed variety
Mr. J. C. Tallack, Livermere Park, Bury St. Edmund's,

had a seedling variety of Apple, much coloured fruits, but

not perfectly ripe.

Another Melon was shown by Mr. G. Tulford, West Park Gardens, Damerham, Surrey; and a seedling Potato by Mr. GEO. WYTHES.

Some fine roots of Celeriae were shown by Mr. Bain, gr. to Sir TREVOR LAWRENCE, Bart., Burford, Dorking; and two large Gourds by Mr. A. G. FREER, New Brompton (Vote of

The Lecture.

Is the afternoon, a paper by Mr. BURRELL upon "Hardy Summer Flowers," was read by Mr. Jno. Weathers, Assistant-Secretary. After remarking that such a subject might per-Laps have been more opportune earlier in the season, when it could have been illustrated by specimens from the beds, Mr. Burrell said that he intended only to speak of a few genera that had during the last few years obtained a much higher place in popular estimation than formerly, and instead of dealing with the hardy flower-garden generally, he should only refer to plants suitable for heds or borders in the near vicinity of the dwelling-house. A few remarks were made upon the planting of geometrical beds with such flowers, close to the house, and emphasis was placed upon the important such cases of making the selection of places very carefully, such cases of the planting with much taste. But isolated house, and emphasis was placed upon the importance in beds upon turf were very much more suitable situations for hardy perennial flowers. Some of the genera selected for mention were Phlox, Delphinium, Antirrhiaum, Campa-nula, Carnation, Helianthus, Asters (perennial), Veronicus, Lobelias, Pyrethrums, Pentstemons, and Violas. Before speaking of some of these individually, Mr.

Burrell remarked upon the wonderful improvement that bad been obtained in several of these genera, in Phloxes, Delphininus, Vielas, Pentstemens, &c. One characteristic of hardy plants was an advantage, a new variety or choice specimen could be multiplied by propagation (which in most instances was very easy), and a good number of plants obtained in a very short space of time. Phloxes could be propagated by cutting , layers, or division of the crown.

propagated by cutting, layers, or arision of the crown.

The soil at Claremont was very light and sandy. Antirrhinums did capitally. The old plants were cut back in
autumn, and the surface of the soil loosened with a fork, after which, a mulching was applied before winter. A few cuttings should be taken every year to maintain a vigorous stock, and the spikes of bloom were better removed as soon as the lowermost flowers were well expanded.

Campanulas were satisfactory in special beds. They were invaluable, and would furnish flowers in colour from Cambridge blue to intense purple, and the white ones were pretty also. Campanulas, Megaseas, and Saxifragas, were some of a number of plants that were more satisfactory when planted by themselves than if mixed with other species. Carnations did very well at Claremont, and were layered early each season, not more than 5 per cent, failing to make

In such soil Mr. Burrell had found it useful to employ In such some at Darien has found it useful to employ spent Mushroom bed manure or similar material, and when planting is finished a mulch is given. Delphiniums were not so happy upon the light land, and flourished best where the hand had been improved by the addition of more retentive constituents. Helianthuses were easily cultivated, and gave excellent results. Lobelias had been much improved. They excellent results. Loosins had been made improved. They were best planted in bold clumps upon a groundwork of Pinks or similar habited plant. They were perfectly hardy at Claremont, but were mulched in early winter. A few remarks of a general character were made upon the other

Mr. Douglas (chairman) said that Phloxes should be propagated from cuttings, and clumps ought not to be left more than two years undisturbed. Carnations should always be planted out in the autumn; they are perfectly hardy.

DEVON AND EXETER GARDENERS' ASSOCIATION.

OCTOBER 7.-Mr. W. CHARLEY delivered a practical lecture on this date at the Guildhall, Exeter, before the members of the Devon and Exeter Gardeners' Association, on "Soils." Mr. A. Hope presided, and there was a numerous attendance.

Mr. CHARLEY devoted the opening passages of his address to an explanation of the degrees and qualities of soils, their ingredients, the provision of proper subsoil, &c.
At the conclusion of the lecture Mr. Currier showed

several examples of Devoushire soils, pointing out their chief

An interesting discussion followed.

Several members gave in their names to enter for the course of lectures on "Plant Life," now beginning under the University Extension Technical Course. A number of the seeds containing larvae of Carpocapsa saltitans were shown, and the description as given in the Gardeners' through of and the description as given in the deriveners chronica of November 12, 1859, was read, showing that this entomo-logical curiosity, to which so much attention has recently been given, was known in England nearly forty years ago.

FUNGUS FORAYS.

LEICESTER.—The annual Foray of the local society took place on Thursday, October 8, and fortunately was favoured with dry weather. The members mustered more strongly than was anticipated, so that an extra vehicle had to be provided for the ride to Charnwood Forest, or what remains of it

The start was made at 1.30, and the return before six, so that it was only a moderate half-day excursion, of which about two hours was occupied in riding; hence a record of between eighty and ninety species may be regarded as a satisfactory result. That out of these nearly a score were new to the record of Leicestershire fungi was gratifying to the organisers of the outing. The only species collected in sufficient number to be prepared for tea were Trichotoma nuda, and Amanita rubescens, both of which gave satisfaction to the consumers. In no case were the specimens numerous, and

some of them were much saturated with moisture. It was remarked that some of the commonest species were conspicuously absent, and although the common Mushroom has been noted as plentiful in many other localities, not a single individual was seen. This was but a shadow of what fungus forays were a few years ago, since the number of specimens of any single species was exceedingly small, but the enthusiasm was little diminished, and the number of species recorded was about of an average for the length of time occupied and the number of collectors. Of the ladies present, one at least rose to the exigencies of the occasion, and manifested an intelligent appreciation of the opportunity to acquire 213 ptogamie knowledge.

WEST KENT NATURAL HISTORY SOCIETY held its annual WEST KENT NATURAL HISTORY SOCIETY held its annual Fungus Foray on Saturday afternoon, October 10, starting from Orphington Station about 2 o'clock, for a quiet walk to Paul's Cray Common, picking up stray contributions by the way. It was not a great party, but a genful one, and the weather, for once, was of the same disposition. One little mannikin of ten years old exhibited as earnest and intelligent an interest in the proceedings as any of his elders, and some of the best things of the day came through his hands Of course his father was a fungus-hunter and had Of course, his father was a fungus-hunter, and had "trained up his child in the way he should go," with success. If more fathers followed the same course the next generation would realise its benefit, but, as it is, "cram" and not recreation, is the order of the day -for juveniles. Upwards of sixty species were collected and identified before 5 o'clock, when the little party settled down at the "Bull" at Chisleburst to a repast, which was accompanied by a dish of Blewits, well prepared. and a smaller one of Amanita rubescens. Somehow all these and a smaller one of Amanda (toescens. Somenow at these forays are strongly utilitarian, and the question of the day is invariably. "Is it good to eat?" Edible fungi were rather scarce in the field, and most of them too much saturated with the late rains; but the little black Mycena pullata was one of the finds, for almost the first time since its discovery at Epping. Boletus piperatus and Chrocybe clavipes are by no means common in the Home Counties, but were represented by single specimens. Although we heard of some of the members enjoying that phase of natural history which is represented by football and bacycle, those who were present did not appear to regret it. M. C. C.

Obituary.

PETER WHITTON.—This well known Perthshire gardener passed away on the 5th inst., at Methven Castle, where he had been head-gardener to the Smythes of Methven, for nearly fifty years. Though not an exhibitor, he was a thorough all-round gardener, and a member of the Royal Scottish Arboricultural Society. It is not given to everyone to strike cuttings and live to see them grow to trees 60 feet high. The Conifers he planted are indeed now admirable specimens.

This year, the kitchen gurden attains its centenary, and it is remarkable that during that period there have been only three head gardeners at Methven. In "the sixties," when the pleasure-grounds were extended, Mr. Whitton planted many Conifers, the main feature being an avenue of Cedrus Deodara. commonly called "The Simla Walk," from the fact that the plants were raised on the place from seeds sent from Simla to Mrs. Smythe by her cousin, the Earl of Elgin, then Viceroy of India.

Mr. Whitton took an active part in the affairs of the parish, being president of the village library for over thirty years, and an elder in the parish church for thirty-six years. His funeral was largely attended, many head gardeners being present; and an act which spoke volumes for the respect in which he was held by the family he so long and faithfully served, was that Colonel Smythe attended his funeral.

Of his five sons, two followed gardening, one being the Superintendent of the Glasgow Public Parks, and the other Superintendent of the Dooars District of one of those new gigantic Tea companies in India. Mrs. Whitton predeceased her husband only six weeks,

Mr. James Jackson, an old pupil whom Mr. Whitton had recommended, has been appointed his successor.

An Agricultural and Horticultural COLLEGE FOR CHESHIRE.—The Cheshire County Council, at a cost of £10,000, has established a new college at Holmes Chapel, which was opened recently by the Duke of Westminster. It is intended to impart sound instruction in all that concerns the cultivation of the land, the complete course extending over three years, and no pupil can enter for a shorter period than one year.

MARKETS.

COVENT GARDEN, OCTOBER 15.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

POTATOS.

Best Potatos wanted, 70s. to 80s.; sound second-class firm, 40s, to 45s. Fear the weather will cause further disease. at 40s, to 45s Supplies short, in consequence of rain. J. B. Thomas.

SEEDS.

London: October 14 -- Messrs, John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report today's market as thinly attended. Good yearling Red Clover seed continue to meet with considerable favour, Red Clover seed continue to meet with considerable datoff, and prices stand very firm. Alsyke and White keep exceedingly strong. Trefoils just now are neglected. The Canary seed in irket is depressed, owing to an expected early heavy arrival of new Turkish. Hemp seed is firm. There is no demand for Tares. Bye is inquired for Wisconsin boiling Peas meet an improved sale. Rape seed is again dearer. In Montard likewise, the tendency is juny ards. Some fire new Mustard likewise the tendency is upwards. Some fine new Californian Haricot Beans are now offering on tempting terms. New white Runner Beans are just landing.

10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending October 10, is furnished from the Meteorological Office :-

The weather was in a very rainy and stormy condition enerally. Sleet and hail showers were experienced at many northern and north-western stations, both at the beginning and end of the period. Thunder and lightning occurred in several parts of the kingdom during the earlier days of the week, and again over the north of England at its close.

"The temperature was below the mean in most districts

but just equalled it in the 'Midland Counties' and the 'Channel Islands,' while in 'England, E. and S.' it was a little above it. The highest of the maxima were recorded on rather irregular dates, and ranged from 64' in 'England, S. and 63° in 'England, E.' and the 'Channel Islands,' to 58° in 'Scotland, W.,' and to 57° in 'Scotland, N.' The lowest of the minima, which were registered about the middle or end of the week, ran from 25° in 'Scotland, N.' and 30° in 'Scotland, N.' land, E, 'to 30' in 'England, N.W.' and to 4' in the 'Channel Islands.' By the end of the period temperature had fallen quickly over the northern half of the kingdom, and the decrease was spreading southwards.

"The rainfall exceeded the mean, the fall being more than twice as much as the normal in nearly all the western and northern districts.

"The bright sunshine was again deheient generally, but equalled the mean in 'Scotland, N.,' and exceeded it in 'Scotland, E.'"

TIGRIDIAS IN SCOTLAND.

Ar Logan Honse, in Wigtonshire, these pretty flowers have been cultivated during the last two seasons with exceptional success. Mrs. McDonall, of Logan, is an ardent horticulturist, and the Tigridia is one of her favourite flowers. Seed brought from Mexico by Messrs, Kenneth & Douglas McDonall, and sown in May, 1895, produced plants which flowered in July of the same year. They received no protection during the following winter, and this year they came up in remarkable strength. On a plot of ground devoted to their culture, 15 feet in length by 5 feet in breadth, the Tigridias produced between July 12 and October 1, 3,751 flowers. Many of the plants reached the unusual height of 3 feet 3 inches above the ground. For these statistics, I am indebted to Mr. Douglas McDonall; and having frequently visited Logan Gardens during their period of floral development, I am in a position to certify that they are absolutely correct in name. The fact that the seed was obtained in Mexico, the native land of those exquisite semi-tropical flowers which equal the finest Orchids in artistic impressiveness, has doubtless had much to do with their marvellous success. The varieties most cultivated at Logau House were pavonia, granditlora alha, conchiflora, and immaculata. The last-mentioned variety, which is a pure white, is especially fine. I have always been of opinion that the evanescence of Tigridias, which, like the Ipomoras of California, seldom last for an entire day, is largely attributable to their perpetual habit and extraordinary productiveness. No sooner has one brilliant flower disappeared than another is preparing to occupy its place. Their rapid development is not less wonderful than their unique perpetuality. David R. Williamson.

ENQUIRY.

AMATEUR GARDENER will be glad to be informe l if lime manure from a tannery is a safe an efficacions top-dressing to destroy worms in a lawn; and if so, what quantity per rod may be safely used! Or can any one recommend an effectual worm-destroyer !

Camellia Fruiting: Ed. S. It is not an uncommon occurrence for these plants to bear seeds, especially the semi-double and single-flowered varieties. See Gardeners' Chroniele, D-cember 27, 1873, for figure of seed-pods. We do not think that the bearing of fruits is the cause of the sickly foliage-that coming, probably, from a soured, ill-drained soil.

Correction. In article on Rose Season, p. 426, col. 2 (about half-way down, should be read, "Messrs. Harkness & Sons, of Bedale and Hitchin, have carried off both Trophies," &c.

Fungus: D. F. Wright. Only one specimen received, and that a section of large brown-spored Cartinarius, insufficient for its determination,

ERRATUM: At the Fruit Show held at the Crystal Palace, Oct. I, 2, and 3, Class 129, for Pitmaston Duchess Pears, the 2nd prize was awarded to Mr. W. Mancey, not Manning, as reported.

GRUBS ON PRIMROSE ROOTS: C. L. We believe them to be those of the smiller cockchafer.

NAMES OF FRUITS.

NAMES OF FRUITS.

* The application to noise devices, and especially fruits, are so numerous at this section, as a verely to two our resources. They ential an expenditure of time, labour, and money, of which our realers have little idea. We are most desirous to oblige our correspondents as far as we can, but we must request that they will observe the rule that not more than six varieties be set at any one time. The specimens should be good ones, judisproaching regeners, and to mercent deappointment, they should be properly auntitated to mercent deappointment, they should be properly auntitated to redeappoint of the productive to send answers through the post. D by in any case is increadable.

Celsia cretica; Orchid next week.

Notice to Leave: J. M. Your case is complicated by the fact of notice having been given by an agent, who may or may not have had adequate authority to act. A full month's notice was necessary under the circumstances. If a false accusation can be proved, you can sue for defamation. Consult a solicitor.

Pelargonium Sport : J. P. The sport, with green and white foliage, and pure white flowers, is very pretty, and from the description you give of the plant's babit, the variety would appear to be well worth preserving. To ascertain if a similar one is already in commerce, communicate with some firm which makes a spécialité of Pelargoniums.

TENNIS COURT ON A SLOPE: S. E. Having determined on the site for the court, make a commence-ment by cutting a level drift from a spot about 15 yards down the slope, and push this drift into the slope until you reach the upper limit of the space to be excavated, or a little more. This drift will afford a guide in removing the soil from the higher part of the site to the lower, as levels can be taken from it to the right and left. The removed soil must be firmly trampled as the work of raising the level of the land proceeds; but we do not think that any ramming is required, as that would be liable, if the soil is heavy, to make it im-pervious to water, with the result that it would be a long time in drying and becoming fit to play upon after rain. In fact, it would be advisable to down three rows of pipe-drains 3 feet, letting these run in the direction of the slope, and empty them-selves on to the turf some few yards down the slope. The sides and ends will have to be made as long sloping banks, merging gradually into the surrounding grass land. Your spirit-level and a builder's "straight-edge" 12 feet long are all the levelling instruments required; although some stout wooden pegs driven into the ground after duly levelling from oue to the other will assist in obtaining a true dead level. A coating of good mould should be spread on the surface before laying the turf. To accommodate the court and the players, a lesser length than 30 yards by 15 yards will not do.

TRUE SEEDS (American) : Enquirer. Mr. J. H. H. Boyd Cagle, Tenn., U.S.A., supplies these wholesale.

WHITE CARNATION: H. H. A good double flower, but the splitting of the calyx is a serious fault, although a common one. Like that of most seed-lings, the constitution is, as you remark, very strong, so that the variety will, for some years to come, not be so liable as older Carnations are to fall a prey to fungus diseases.

Words ending in "I" and in "II": Enquirer. In practice this is pretty much a matter of individual preference. If you are a Latin scholar, you will have no difficulty with purely Latin words; but when a word from some other language becomes Latinised, there is room for difference of opinion, and still more for variation in practice. So far as any rule at all can he laid down, we think enphony suggests the following practice:

Words ending in a consonant have a single "I"

in the genitive thus, Alocasia Sanderi. Words ending in a vowel have two "II" in the

genitive-thus, Alocasia Backhouseii.

Words ending in an aspirate take the double "H" -thus, Alocasia Veitchii.

Words ending in a sibilant take the double " ii " thus, Alocasia Williamsii. But as we have already said it is, except in purely classical words, a case of do as you please '

AND SIXPENCE FOR EVERY ADDITIONAL LINE. If set across two Columns, the lowest charge will be 20s. If set across three Columns the lowest charge will be 30s. Page, £8; Half Page, £4 10s.; Column, £3.

Advertisements guaranteed to appear on the front page are charged at the rate of 1s. per line, head line counting as two lines. No display is allowed.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertise-ments must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Position.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

Notice to Advertisers.—In many instances Remittances in Payment of Repeat Adver-tisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting

to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. G. COVE, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

A 'vertisements for the current week MUST reac' the Office by first post, Thursday morning.

Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 11. WELLINGTON STREET, STRAND, W.C.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates.

THE "WORCESTER HERALD,"

ESTABLISHED 1794,

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Muchinery, Furniture, Books, and other property advertised in the columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD." the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

TWO SILVER BANKSIAN MEDALS

HAVE BEEN AWARDED TO US

FOR

COLLECTIONS OF GARDEN PEAS

BY THE

Royal Horticultural Society.

BY THE

NEW PEA-

'BOSTON UNRIVALLED."

The superior merits of this new Pea have been recognised by the Committee of the Royal Horticultural Society, after competitive trials at Chiswick in 1896, who awarded it the highest distinction, three Crosses (XXX), and a First Class Award of Merit.

We ventured to predict this very fine Pea would gain appreciation from those who gave it a trial, and the many gratifying reports we have received are convincing testimony as to its general excellence and popularity.

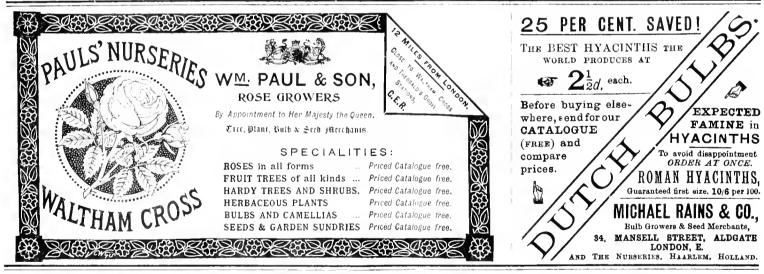

"Boston Unrivalled" is a remarkably handsome Second Early Marrowfat Pea, of the best table quality; height, $2\frac{1}{2}$ to 3 feet; pods large, 5 to 6 inches in length, of the "Telephone" shape and colour, but more even in size than that well-known variety, there being from 9 to 11 fine peas in the pods; these mostly hang in pairs, literally covering the haulm, which is robust, and not subject to mildew.

The extraordinary productiveness of this Pea is a marked feature, and in our extensive trials of Peas has always been conspicuous for the profusion of its pods. As an Exhibition variety it has searcely a rival, and for private gardens, or market growers, is alike valuable, and undoubtedly ranks as a decided improvement and great acquisition in profitable Horticulture.

Retail Price:—Per sealed Half-pint Packet, 1s. 3d.; Pint Packet, 2s. 0d.

SATURDAY, OCTOBER 24, 1896.

BAD-NAUHEIM.

BAD - NAUHEIM, a small town of 3,000 inhabitants, is so called to distinguish it from Nauheim near Gross-Geran; it is about one hour by rail north of Frankfort, and a rising watering-place long celebrated for its warm saline springs. It lies at the foot of the last spur of the Taunus mountains called Johannisberg. There is a pleasant walk of about a mile to the summit, on which is a tower, the last remains of an old monastery surrounded by a wood. At a quarter of an hour's distance is the Frauen forest; joining it on the south is the Nauheimer Hoch forest. A drive connects and passes through them. Another walk may be made to the neighbouring village of Schwalheim. where the chalybeate spring rises, affording an exceedingly agreeable effervescing draught. Friedberg, with its picturesquely situated Schloss, where the Grand Duke of Hesse-Darmstadt often resides, is within threequarters of an hour's walk of Nauheim.

Some quarter of a century ago, Nauheim was, perhaps, more frequented by gamblers than patients; but when the "tables" were suppressed in 1872, it changed its nature, and is now a most important curative place. One advantage of former days remains in the magnificent park of 150 acres, having a profusion of trees of all sorts, and of all ages from sixty years' growth downwards, as fresh ones are continually being planted. They are grouped in fine avenues, or in clusters, or singly. The park is intersected by broad walks, covered with grey, coarse riversaud; so that new aud charming views open out at every turn. At one end is a large take, supplied by the Usa-bach, about one mile round, with wooded islands, and numerous swans and ducks. This affords plenty of boating, fishing, and bathing. The whole of the park is perfectly free to all the world. At the highest part of the park stands the former gambling-house, new called the Kurhaus. The fine large rooms are converted into reading, dining, billiard, and other purposes; while outside is a broad terrace, partly under cover of a glazed roof, for tea, &c., and promenading, while a band plays every afternoon and evening. To support these luxuries every visitor is subjected to a small tax.

As the Kurhaus stands on the elevated terrace, the grassy slopes below are almost the only parts where flowers are cultivated. These deserve much praise. Of course, no one here, or elsewhere, in Germany, ever dreams of walking on the grass, because turf, as on an English-mown lawn, does not exist. They sow the Grass-seed every year, and the short, erect foliage delights the German eye.

Against the wall of the terrace, and by the sides of the central steps, is a tall bank of a cordate leaved Polygonum, terminating above with its Spiraea-like feathery inflorescence. Then come massed groups of Cannas, blazing with searlet and gold, and edged with ordinary garden flowers, as Petunias, Zinnias, Gaillardias, &c. Numerous round and other shaped beds adorn the slopes. Of these there are some interesting features. One is, that of some excellent earpet-bedding; but it is combined with taller herbaceous plants. Thus in one, arising out of low and variously coloured herbage in patterns, are little standard Heliotropes or Lantanas, from 2 to 3 feet in height. In another one the circles are filled with Begonias or an A gave, or groups of Asters, Pelargoniums or Lobelias, &c. This combination of carpeting with herbaceous flowering plants has a very pleasing effect. Of isolated plants, there are clumps of Arundo Donax, Bocconia japonie, about 8 feet high; Musas, Nicotianas, &c. Another peculiar feature is a pair of beds with Coxeombs "reverting," i.e., throwing up tall and semi-fasciate and partially-feathery masses; while other beds contain excessively dwarf Coxcombs massed together. Fuchsia fulgeus, Castor-oil plants, and others make small and effective clumps.

Vases are arranged at intervals along the terrace. Each contains an Agave, but its sombreness is relieved by the addition of flowering plants, as Tropæolum peregrinum, Japanese Honeysuckle, Petunias, &c., being grown in the same vase. All the tall pillars supporting the electric lights are similarly ornamented. Indian corn, variegated Hop and grasses, Tropæolums, Cucurbits, &c., are missed round the base, while the climbers scramble as high as they can up the pillars.

The great feature of Bad-Nauheim is, of course, the saline springs. One called the "Sprudel" shoots up a massive column of water 25 fect or more from the centre of a circular enclosure. This contains a large amount of common salt in solution, besides carbonic acid and other ingredients. Its great value for medicinal baths resides in the action of the strongly affervescing gas on the skin. Smaller springs supply saline medicinal waters. These are drunk between 7 and 8 a.m., while a band plays, the patients walking about among the trees and flower-beds enjoying (?) their draughts.

An ingenious method is adopted to concentrate the salts. As coal is an expensive article in Germany, they have erected gigantic walls of faggots some hundreds of feet long and about 50 feet in height. The brine is conveyed to them by pipes, and then made to turn a wheel so as to pump the water to the top. It then percolates through the faggots, evaporating as it trickles down; the water containing the condensed salt is now collected below. A platform is erected all along the side of this wall of faggots, with covered seats, where patients sit and take "whit's of the briny," trying to imagine they are seaside breezes "

A remark may be made about the wild flowers of the neighbourhood, as well as along the saline springs elsewhere of this part of Germany, in that the presence of salt has developed quite a quantity of "saline plants." Thus the maritime Plantain, common on our own sea-shores, is most abundant, as well as Spergula maritima, a "maritime" form of Atriplex, &c. They grow by the side of the paths leading to the "saline evaporators," as they may be called. The question arises, how did they get there? For Bad-Nauheim is about 200 miles from the nearest sea-coast. Have they travelled from the shores of Hol-Jand, or have they been "evolved" on the spot?

A last word on the floriculture of the locality, This is devoted to Roses, especially for cut blooms. Several villages around are noted for Rose-culture,

e.g., Steinfurth, which contains the largest Rose garden in Germany, with some millions of Roses. They are grown as dwarfs, about a foot high only: this renders them easy of management, and very floriferous. George Henslow.

FLORISTS' FLOWERS.

EARLY-FLOWERING CHRYSANTHEMUMS.

THESE flowers have withstood the wind and rain lately far better than anything else in the herbaceous borders, with the exception of the Michaelmas Daisies; but as the Chrysanthemums give a much greater range of colour, they have proved by far the more useful flowers for cutting purposes and garden decoration. The following varieties are the best that I have for flowering up to September 30:-Alica Butcher, bronze; Alexandre Dufour, claret; Arthur Crepy, pale yellow; Lady Fitzwigram, pure whitedoes not fade like Madame Desgranges; La Vierge, good white: Madame Louis Lionnet, fawn, Japanese; Madame Charvin, crushed strawberry, Japanese; M. Gustave Grunerwald, bright pink, tipped yellow, Japanese; Madame Desgranges, white; Mrs. Hawkins, yellow; Précocité, Japanese, blush with purple and yellow centre-very distinct and pretty; Piercy's Seedling, yellow, shaded with brown; Roberta, deep yellow; Sadington, grey; Vicomtesse d'Avene, reddish - purple, Japanese. The majority will survive an ordinary winter outside if protected with some short litter or coal-ashes; but to make sure of keeping the stock, it is best to have a plant of each kind in a cold frame, and to strike cuttings early in the spring. This plan also ensures a change of position for the plant each year, which is very necessary in order to get good flowers, as the old stools, if allowed to remain, grow taller and weaker the second season, and their flowers are not so good. I have sometimes lifted the plants from the borders just when the flowers commenced opening, and potted them for conservatory use, &c., and have found that they retain their foliage and flowers well if placed in a sheltered position and syringed for a few days; they also make better specimens in this way, than when kept all the time in pots, and there is less labour in watering, &c.; but the colours of the flowers are much brighter if grown and flowered outside entirely. W. H. Dirers, Belroir Custle Gardens.

THE ROSARY.

ROSES IN POTS.

Now that our supply of cut Roses from plants in the open has disappeared, it behoves us to look for our winter and early spring supply of blooms to plants in pots. Unless one has a house devoted entirely to Roses, it is not an easy matter to grow them satisfactorily. Although the practice of successful growers has been given in these pages many times already, the present opportune season, and the importance of making a correct start, are reasons for reverting to the subject. He is indeed a clever grower who can succeed in getting a satisfactory crop of blooms from plants that have been improperly treated. Therefore, let us see what condition a pot Rose should be in previous to forcing it. Whether the variety be a vigorous grower of the Maréchal Niel and William Allen Richardson type, or one of more compact growth, such as Catherine Mermet, Niphetos, and Francisca Kruger, it is essential that the plant be well matured. A well-ripened pot plant is seldom so utterly denuded of leaves as the same variety when lifted from the open ground; nor is it necessary it should be.

I would strongly recommend that all Roses intended for future pot culture be purchased in pots in preference to plants from the open nursery rows. In most cases a more bushy plant is obtained, and such plants are invariably more amenable to culture in pots, than are those lifted from the ground. The most suitable varieties are quite as cheaply ob-

tained in this form and a start can generally be made the same season, which is hardly possible with lifted plants. If they are purchased in 4-inch pots, the plants may be repetted into others, 6 or 7 inches in diameter. The type of Rose I would recommend for this treatment, includes G. Nabonnand, Maman Cochet, Niphetos, The Bride, Madame Lambard, and other free growers which flower from almost every growth. Commence with a ripe though small plant, and little pruning is needed; only cut out the weakest centre growths, and shorten the remainder half-way.

I would also select small pot plants when purchasing those varieties usually grown as climbers; Maréchal Niel, William Allen Richardson, Climbing Perla des Jardins, and similar varieties, unless one can secure these in pots of extra large size, and earrying rods ranging from 5 to 10 feet in length. Small plants of elimbers should be grown on for a season before full crops of flower are permitted. We must work upon the same lines as when growing climbers upon our houses: none but sound rols of the previous season being likely to give a profitable crop of blooms, and under correct culture it is possible to get a heavy erop in a short time; also to cut back the plants and thus allow more room for others until such time as the most forward can be stood ontside. There are sure to be several plants not doing sufficiently well to pay for house-room after the end of May. This cutting away of wood that has flowered is practically the only pruning necessary for climbing varieties when grown in pots.

Thus far I have only spoken of plants in the first season they are forced. Established plants need more detailed pruning. For example, a Maria Van Houtte, or Niphetos, in a 12-inch pot will be earrying a large bush of wood, much of which will be composed of laterals, which besides being weak, will be crowded towards the centre. The first thing is to remove the whole of such growth, and then prune back the remainder more or less hard, according to its position. It may happen that three or four good pieces of wood are close together. If it is not possible to tio the surplus shoots into a less crowded part of the plant, it will be wiser to sacrifice some of them. At the same time as many blooms as possible are wanted during winter, and therefore do not prune quite so closely as would be done in the open, where quality is the point most considered.

I am taking it for granted that the plants have had the benefit of open air treatment from about the early part of July, and if they were forced last season, such plants will now possess firm and partially dormant wood. The next items to consider are drainage, and re potting or mulching according to requirements. A free outlet for surplus water is most important, but it is often only necessary to pick out a little dirt that may have stopped the holes during the late summer exposure. If the plant was re-petted last season, the removal of the top-soil as far as possible without serious root injury, to be followed by a good mulching, will be sufficient. Before adding the new compost I sprinkle a little dried blood-manure upon the old ball, and then fill in firmly. Care should be

season, the removal of the top-soil as far as possible without serious root injury, to be followed by a good mulching, will be sufficient. Before adding the new compost I sprinkle a little dried blood-manure upon the old ball, and then fill in firmly. Care should be taken that the old ball is sufficiently moist not to need much water, or the best-feeding properties of the compost and manure will not only be washed away before the roots can utilise them, but the compost itself will become more or less sodden. Many growers have an objection to re-potting Roses intended for early foreing, but I have found it a great advantage if care be taken not to greatly disturb the roots. A plant that has been growing all the summer will have exhausted the food in any ordinary compost, and the Roses need more or less fresh soil. Even if they are turned out, the loose soil broken off as far as possible, and then replaced in the same pots, 1 find we get more vigorous growths. Much soil can be removed without disturbing the roots very much, and new roots certainly push out more freely and

quickly when a little fresh compost is added.

After pruning and potting, a cool temperature for two or three weeks is an advantage. This allows of the formation of new roots, and the wood and eyes become plump and ready for a start as soon as a

slight rise is made in the température. Under more hasty treatment, the wood may become excited before root action, and a week or two later receive a check, which, however slight, is harmful. Early in November is an excellent time to start pot Roses to bloom from January onwards, and the temperature should never exceed 55° to 60° notil the flower-buds in the ucw growth are visible, when a rise of 5° to 10° will be safe, if thought necessary. A steady temperature, absence of draught from ventilation, and due care in watering are essential; but a very little natural rise or fall, according to outside influences, is not harmful. Care in these matters will generally prevent mildew, and blind or flowerless growths. Insects must be combated from the first, but the methods for destroying these are well known, and need not be mentioned here. Weak manure-water sprinkled about upon a bright day, or at any time when the atmosphere may be dry, will help to keep the foliage healthy and clean.

The selection of varieties is of considerable importance, and I would not have these too numerous. Maréchal Niel, Climbing Niphetos, William Allen Richardson, Crimson Rambler, and Climbing Perle des Jardins, are grand when growu upon the long-rod system, and can be flowered with certainty each season. More compact growers are found in the following eighteen, which will afford a good variety of colour and form, Augustine Guinoisseau, Mrs. W. J. Grant, Caroline Testout, Marjorie, Francisca Kruger, Edith Gifford, Madame de Watteville, Maman Cochet, Madame Lumbard, Niphetos, Catherine Mermet, The Bride, Madame Eugène Resal, Souvenir de S. A. Prince, Medea, Genéral Jacqueminot, La France, and Captain Christy. A. P.

ORCHID NOTES AND GLEANINGS.

CATTLEYA \times BRYMERIANA = C. SUPERBA \times C. ELDORADO.

This novelty is about as large as C. superba, but the influence of C. Eldorado has moulded it into a closer, more beautiful form. The parents have dwarfed pseudo-bulbs, and, as is well known, neither of them shows a disposition to grow freely for any length of time. There are three flowers on a prettylooking healthy plant. The sepals are lanceolate; the petals are rhomboid, and close well together, and are of a deep rose-tiut, a shade intermediate between the rich colour of C, superba, and the paler colour of an ordinary C. Eldorado. The lip is finely and permanently inflated, the purplish-rose of the base of the blade being beantiful, and the paler colour up the tube being elad with distinct yellowish lines. It is a very striking hybrid flower, showing its parentage in its face; and the plant is in excellent condition, as nearly every one of the Cattleyas are in Mr. Statter's famed collection, under the wise management of Mr. Robert Johnson, and are improving with age. For a full description of the earlier life of Stand Hall Cattleyas, see Gardeners' Chronicle, October 19, 1895, p. 454, col. c; and p. 455, cols. A, B, C. J. A.

MILTONIA CLOWESH VARIETY,

A flower of a very singular and pretty variety of Miltonia Clowesii has been sent by H. Cary Batten, Esq., Abbot's Leigh, Bristol, who says of it:—"I bought it at a sale about two years ago, and I suppose it was an imported plant, although it was potted before I bought it. At any rate, it had a very neglected appearance until I took to it; but I see no reason wby it should not now go on well, there being several good healthy bulbs in the pot. It has always borne the name 'Miltonia spectabilis,' but now that it has flowered it is proved not to be that species."

The flower had the sepals and petals of a bright Indian-yellow colour, and with but few of the brown blotches which cover the greater part of their surface in ordinary forms. There is a light purple tinge at the hase of the segments around the column, and the base of the lip is rose-purple, and its blade white.

CATTLEYA × LORD ROTHSCHILD = C. GASKELLIANA × C. AUREA.

This is a fine hybrid Cattleya, with flowers as large as those of either of its parents, and an exceedingly

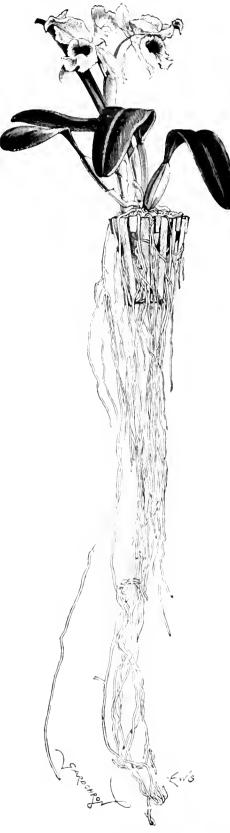

Fig. 86.—CATTLEVA > LORD ROTHSCHILD = C. OASKELLIANA Y. C. ACREA.

(Greatly Reduced.)

pleasing blonding of the colours. It was in flower at M. Wells, Esq.'s collection at Sale two years ago, and last year at Stand Hall, where it now is; and this year it is much superior to what it then was. The plant, which was a small piece, which I saw taken off

the original certificated plant at Broomfield, Sale, is now in a teak-basket, and its roots have pushed through the interstices of the basket, and elongated themselves to abnormal dimensions, measuring about 4 feet from the point of junction with the pseudobulbs (see fig. 86). The segments of the flower are of the form and size of a large Gaskelliana, and of similar pale rose colonr, only having a dash of the aurea marking, which, as orchidists are aware, is more common to the lip, however, than to either the sepals or petals of that species; the upper portion of the labellum is very much inflated, and forms a deep tube, which is adorned at its orifice with an orange blotch, shading off to nankeen, as in C. aurea. It maintains, however, the circular form of its seed parent, but has the fine shade of purplishcrimson of its pollen-parent. A charming novelty, confirming the justice of the award of the First-class Certificate of the Orchid Committee.

CHEMISTRY OF THE STRAW-BERRY-PLANT.

In order to ascertain the requirements of the Strawberry crop, and its effects upon the soil, complete analysis of four varietics of Strawberries have been made by Professor F. T. Shutt, M.A., F.I.C., F.C.S., of the Canadian Department of Agriculture. The names of these varieties are Sharpless, Crescent, Wilson, and Manchester, the whole plant, including roots, being examined. The plants were collected while in flower during the month of June, and before the fruit had appeared. They were carefully freed from adhering soil, weighed, and analysed.

The subjoined table gives, in addition to other information, the percentages of water, organic matter, and ash or mineral matter, which together make up the composition of the plant.

Analysis of Strawberry Plants (Whole Plants in Flower, calleded June 4).

	Weight	Composition of Plant.					
Name of Variety.	of Plant.	Water,	Organic Matter.	Λ×h.			
	02	l'er cent	Per cent	Per cent			
Sharpless	::	72.79	25:15	22 (16)			
Crescent	31	70.35	27:13	2362			
Wilson	07	72/50	24.89	251			
Manchester .	,; <u>}</u>	73:43	24.77	1.50			
Average of (3 1	72 32	25:49	2 19			

Water.—This, as well known, is a most important constituent to the well-being of all plants, its presence in certain proportions being ab-olutely essential to plant-life and the performance of the functions of food digestion and assimilation. It is the vehicle by which the assimilated food is conveyed to the various tissues and organs of the plant.

The importance of a plentiful supply of soil water for the growth of the Strawberry plants and their abundant fructification, cannot be over-estimated, seeing that the plants are made up of 72 per cent. of water, and the fruit of 90 per cent. of water. It may be here remarked that the tilth, cultivation, mulching, and the presence of humus (as furnished by an organic manure), have largely to do with the conservation of soil-moisture in the open garden, or in a plantation of Strawberries.

Organic Matter.—Very little is known as to the precise manner in which the decomposition of carbonic acid is effected within the plant. It is known, indeed, that the decomposition is in some way intimately connected with the green chlorophyl grains to which the colour of the leaves is due; and it is known that light is necessary in order that the decomposition may be brought about; but as all the constituents of organic matter, save nitrogen, are procured from the atmosphere, it is nnnecessary here to consider it. Special remarks on the nitrogen contained in the Strawberry-plant will be made when considering the elements removed from the soil.

Ask.—This represents the mineral ingredients taken from the soil by the plant. Its two most essential constituents are potash and phosphoric acid.

The data given in the foregoing table calls for no special comment in detail. There is a great similarity in the composition of the four varieties of Strawberry-plants, the variation from the average being small.

The following interesting table gives the percentages of the important constituents in the ash of the whole Strawberry-plant in flower, collected June 4:—

Percentines of Important Mineral Constituents in whole Steamberry Plants.

			Variety.		
Constituents.					$M\!\circ\!\!\mathrm{un}.$
	Sharp- less.	Cres- cent.	 Wilson.	Mun- chester.	
	Percent	Per cent	Per cent	Per cent	Percent
Phospheric Acid	¥*633	7.08	5.80	5188	6.09
Potash	20001	24:25	24:31	26,503	26.00
Sod:	10:	0.78	1/20	1.09	1 +14
Iron oxide and alumina .	2:47	2 10	2,42	2.04	2124
Lime	2167	29 10	27:82	24.75	26:33
Magnesia	47-141	5.19	6.11	7:13	6:1:
Silica	4*02	5.1404	1:60	5 89	1.19

It is here noticeable that no great differences exist between the plants analysed, in regard to the constituents—phosphoric acid, soda, iron oxide, magnesia and silica, beyond what might be accounted for by slight variations in the composition of the soil in which they grew. There is, however, a difference of about 5 per cent. in the constituent potash, between the highest and lowest; and a difference of about 6 per cent. in the constituent lime, between the highest and lowest amounts. J. J. Willis, Harpenden.

(To be continued)

BOOK NOTICE.

THE GENUS MASDEVALLIA. Issued by the Marquess of Lothian. Plates and descriptions by Miss F. H. Woolward. Parts VIII. and 1X., with introduction, map, appendix, &c. (Porter, London, 1896. Price £1 10s. each.)

WE heartily congratulate Miss Woolward on the completion of her work on this quaint and interesting genus of Orchids. We have already referred, in our notices of previous parts, to the beauty, completeness, and botanical accuracy of the coloured drawings, and to the excellence of the descriptions; we can safely say, in addition, that the work as a whole forms a valuable contribution to Orchid-literature, and will be as highly prized by the botanist as by the horti culturist. Orchids, perhaps, more than any other other group, need illustration. One of Miss Woolward's drawings, with the very complete analysis of the flower which invariably accompanies the sketch of the whole plant, tells us more than the most elaborate description. Unfortunately, the necessary patron of such an idition de luxe, is not often to the fore, and the combination of the artistic and scientific capacity required to carry the work through is quite as rare. At the close of the introduction, Miss Woolward modestly suggests that from want of training as an artist and a botanist, she felt hardly qualified for her undertaking. We must leave those who know to criticise the drawings from the artist's point of view; we are assured that they will comfort the soul of any botanist who has occasion to work at the genus. And the descriptions in their lucidity and completeness will put to shame many a trained systematist.

The two last parts contain drawings and descriptions of the following species, M. auro-purpurea, M. Barlacana, M. calura, M. campyloglossa, M. cupularis, M. crythrochete, M. Laucheana, M. Ortgiesiana, M. platyglossa, M. Vespertilio, M. attonuata, M. fulvescens,

M. marginella, M. Nycterina, M. pusilla, M. Schroderiana, and M. triglochin. The total number of species figured is eighty-four, and there are besides almost as many which, from their not being in cultivation, Miss Woolward has been unable to include. Most of the drawings are from plants in the Marquess of Lothian's collection at Newbattle; for others the material was supplied by Mr. F. W. Moore, of the Glasnevin Gardens, Dublia, and by others interested in the genus. A few represent species still unknown in Europe, and have been made from sketches sent from South America, by Señor Rodriguez, of Rio Janeiro, or Consul Lehmann, the German representative in the United States of Colombia.

With the last part is given an outline of an arrangement of the species in sections. There are fifteen of these, most of which were indicated by Professor Reichenbach, though he frequently omitted, when describing a new species, to refer it to any section. Miss Woolward is therefore largely responsible for the arrangement as it stands, and also for a new section, Reichenbachiana, including M. Reichenbachiana and allies; and a second, Racemosie, including M. racemosa and another species not in cultivation, M. Eduardi, which resembles it in habit. Each section is briefly diagnosed, and the names of the species figured follow in alphabetical order; a list of species not under cultivation is also given. It is suggested that the plates and descriptions should be bound up in the order thus indicated, the sections following alphabetically.

The introduction gives an account of the history and geographical distribution of the genus. Its history is brief, but there is a touch of romance about it. It was founded by the Spanish botanists, Ruiz and Pavon, who discovered a species in the Andes of Pern, towards the close of the last century. The name was a compliment to their fellow-countryman, Josepho Masdevall, court physician and patron of botany. The species, M. uniflora, in spite of the concise indication of its locality, has never since been found, and, so far as we know, is represented only by four dried specimens, two of which are at Madrid, one at Geneva, and the fourth in the British Museum Herbarium. The greater number of the species have been discovered during the last twenty years. Their geographical distribution is very clearly portrayed in the map of Central and South America. This shows at a glance that Maselevallias are largely mountain plants, inhabiting the great American chain, from a latitude of about 20° N., in Mexico, through the central Cordillera of Costa Rica. and the Isthmus of Panama, and southwards along the Andes of Colombia (their chief centre) and Peru, to 16° or 17° S. Their range extends in a northeasterly direction in the mountains of Venezuela, and as far as French Guiana. Nine or ten species have also been discovered on the other side of the continent, in the Organ Mountains of Brazil. An interesting exception to this general distribution is found in M. yanaperyensis, discovered by Schor Rodriguez, far away from the sea-coast, in the low-lying marshy forest near the sources of the river Yanapery, in the interior of Brazil.

Though the majority of the species are mountainliving, the genus has a remarkably wide vertical range. Apart from M. yauaperyensis growing at an altitude of only 195 feet, Consul Lehmann has found them upon the trunks and roots of trees close to the shores of the Pacific Ocean; on the other hand, the brilliant M. coccinea and its allies abound at 12,000 feet in the mountains of Colombia and Peru, while M. racemosa has its home at 13,500 feet in the Andes of Popayan. In the more elevated regions the plants are terrestrial, growing in the crevices of volcanic rocks, and in the shade of the low shrubs which cover the wind-swept hill-sides. At a lower elevation, in the damp and misty forest region, where, too, they most abound, they are chiefly epiphytic on trunks and branches of trees.

Much has to be learnt about their methods of fertilisation. The considerable variation in the plan of structure of the flower indicates an equally wide variety of method and of insect assistance. But work like this can only be done in the natural habitat of

each species; and it is to be regretted that the observations made by Consul Lehmann were not available for publication. A. B. Renulle,

METHODS OF PROPAGATION,

(Continued from p. 393.)

By Seed.-The methods of propagation I have touched upon recently, have hitherto been what may be called artificial in contra-distinction to natural ones Robert Brown, Darwin, of grateful memory, and other patient observers in still later days, have shown us that the structure of the flower, its colour, its aroma, and other peculiarities, are all arranged with one great important aim in view, the re-production of the plant by means of the seed; and although we may make use of other means of increasing the number of any given plant, yet the most simple, and at the sume time the most perfect, method is to sow the seed. This is so self-evident, that I am quite prepared for a retort, "Every one knows this much." Let me reply in the words of my lamented friend, Peter Henderson of New York, "I believe that one half the complaints that one hears about failure of seed, are due not to the quality or age of the seed, but to improper treatment in sowing. Either the seed is sown too deeply, too shallow, too thickly, or on the other hand the seed bed is composed of improper materials, or the artificial heat and moisture have been in excess or inadequate." As regards the time to sow, there is no golden rule, although the opening months of spring are doubtless the fittest season. Whatever the explanation, as practical gurdeners we know that there is less difficulty in raising seedlings in the spring than at any other time.

The depth must depend greatly on the nature of the soil, but a safe rule is to sow about as deep as the diameter of the seed to be sown, if the sowing is made under glass, and deeper if it is outside; while some seeds germinate better when merely scattered on the surface and left uncovered, others may be buried to a considerable depth with advantage, while methods must vary for the same seed sown in the open, or under glass, in pots, pans, or boxes. Whether in or out-door sowing is undertaken, the general rule is to make the seed-bed or the soil in the pot or pan firm, but not hard, or "panny," as it is called; then gently stir the surface, sow the seeds, and cover them to the required depth, or simply make it firm again by gentle pressure, or by treading if it be a bed.

Calceolaria seed, one of the smallest the gardener has to deal with, is best treated thus :-Let your pan or pot have at least one-third of its depth made up of crocks, and on these place some fibry loam or peat, and fill nearly or quite up to the rim with fine friable soil, consisting of loam, leaf-mould, and a small portion of sharp sand; press this firmly to within half an inch below the rim of pot or pan, and afford water with a fine-rose watering-pot; stand the pots, &c., aside till the water has drained away and left a workable surface, then sow the seeds evenly and thinly, but do not cover with soil. Now put a piece of clean glass big enough to cover each pot or pan, and place in a cold pit or frame, shiding them from the direct rays of the sun, and in a very few days the seedlings will appear. Directly they develop their first pair of true leaves, they may be pricked off into other pans, similarly prepared, shaded for awhile, and kept moderately moist, as too much water will cause them inevitably to fog off. Some recommend a sprinkling of powdered charcoal over the surface of the soil as a preventative, but I fear it will be found quite useless to ward off this most insidious pest if other things are not all right.

Remember the Calceolaria abhors heat, and except when flowering, direct sunlight likewise. One of the most successful growers in the North used to grow his plants from seed to flowering entirely in cold pits, merely protecting with mats and litter in severe frosty weather, and the result was always clean, dwarf and sturdy plants, that asked for no sticks to support them, and which threw up fine heads of large, well-shaped flowers. The time to sow is the months of July and August, and the best place is a cold frame or pit with north-east aspect. Sowings may be made up to September.

The Cineraria should be treated almost in the same manner, but the seed should be slightly covered with light friable soil, or a pinch of sand, and as soon as large enough, the seedlings should be pricked off into shallow boxes or pans. May and June are good months in which to sow Cineraria seed, but the young plants must be kept as cool as possible. If grown cool, the danger from aphides and thrips will be more easily avoided. The caterpillar of the common white butterfly (Pieris brassice) is very fond of young Cineraria leaves, and must be circumvented by careful watching and picking.

RÖNTGEN ILLUSTRATIONS OF FLOWERS.

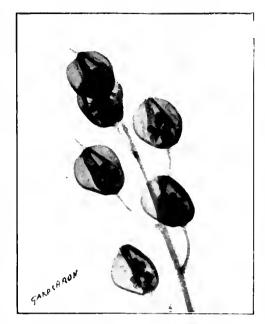

ABOUT the middle of last February, I invited some of my students in the University Extension College, Reading, to assist me in making experiments on Röntgen photography, and a class was formed for this purpose, consisting of Messrs. Herbert, Hooper, Soper, Twiney, West, Yetts, and my colleague Mr. Dodgson. I suggested in the first place that we should photograph similar-sized fragments of all manner of substances, to find out which are transparent to the X-rays, and if possible to ascertain the causes of transparency and opacity. One evening Mr. West brought a number of pieces of red, orange, yellow, green, blue, and violet glass-these were grouped upon a plate and photographed, when to our surprise, the violet glass came out much more opaque than any of the others, not excepting the black. 1 pointed out that the next step must be to analyze the glass in order to ascertain whether its opacity was due to any chemical contained in it, and also to try it side by side with other violet substances, to see if the effect was connected with the colour. The analysis was entrusted to Mr. Twiney, who found cobalt and alumina in addition to the ordinary constituents of glass.

Meanwhile, Mr. West had the idea that a flower such as the Hyacinth, while of the same colour as tho glass, would be entirely different from it in composition; and accordingly in our next experiment he placed a deep violet-coloured Hyacinth by the side of the coloured glasses. On developing the photograph, the flower was distinctly seen, and I found ou examining it with a lens, that not only the outline of the petals, but the veins and the internal structure of the ovary could be traced. Since that time, Mr. West, to whom the original idea is due, has followed up this branch of the subject in conjunction with myself, and we have taken a large number of photographs of plants, flowers, and fruits. It is not every focus-tube that will photograph a flower, those that show the bones of the human body best are quite useless for this purpose; the Röntgen-rays emitted by them go right through every part of a flower, just as they go through solid flesh. It is only the feebler rays from tubes barely capable of showing the bones of a child's hand, that can reveal the internal tissues of a plant.

It may be asked, what parts of a leaf or flower are shown in these Röntgen photographs? The answer is, tissues containing air are more transparent, and those containing much water are more opaque to this kind of X-rays. Hence, any portion of a leaf, such as a vein thicker than the rest, will come out more strongly in the photograph. By carefully regulating the exposure, Mr. West and I succeeded in photographing the veins on the petals of a purple Clematis. But colour apparently has very little to do with it, for we succeeded equally well with pure white flowers. Hollow stems, and the mature pith of most plants come out very distinctly by virtue of the air in them.

Seed-vessels especially make very pretty objects, the seeds appearing as if enclosed in an almost perfectly transparent envelope, as for example in the Hyacinth, fig. 87, and the Columbine. Most flower-

buds photograph well, but the details are as a rule too minute for reproduction. Thus, in a Daisybud, the partially-developed petals, and the crowd of florets on the disc, and also the softer central tissues of the receptacle, can be made out with a lens. If

Fto 87 - FFLOXI-III OF ALCOHOL HOWING SELL IN THE INDITER.

only one could photograph these tissues on a magnified scale, I believe the outline of every cell would be seen, as is the case with some of the larger vessels in certain kinds of wood. But magnification is at present impossible in photographing with Rontgen-rays.

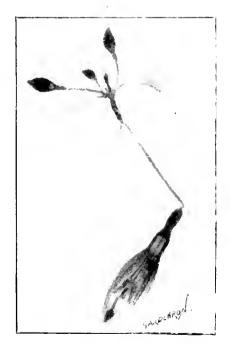

Fig. 88.—) Definite matrix showing the parts of the flower.

The Fuchsia is perhaps the best subject for reproduction, because its internal details are fairly large and simple. It is shown in fig. 88.

The Snowflake, known locally as the Loddon Lily, is another good example. The internal structure of the ovary can be seen, and the ovules distinguished. Some tissues, apart from the water they contain, seem to be more opaque than others. I have

photographed the green berries of the common Laurel, and find that the kernel of the seed and its hard shell can be distinguished even when the entire berry is immersed in water. A young Apple, about the size of a Cherry, showed the core sharply outlined, but very faint. Beech nuts were clearly seen within the green fruit. Horse-Chestnuts, about a week after the fall of the flower, showed very little detail, the young nuts being barely distinguishable from the husk. As the development proceeds, the difference becomes more marked, evidently because the nut grows more solid in texture, and acquires a hard skin, while the husk becomes spongy.

It is noteworthy that a stick of charcoal, photographed by the X-rays, shows the pith, if there is any, and the grain of the wood.

The work done by the other members of the class related mainly to branches of the subject which do not come within the scope of an article in the Gardeners' Chronicle. 1 may, however, mention that all our subsequent experiments confirm the views which I first expressed in a public demonstration of Rontgen-photography on March 18, that just as we have light of different colours, so also there are Röntgen rays of different kinds; and just as blue light will pass through the lens of a caucera, but is stopped by ruby glass, while red light is transmitted by both, so also the Rontgen rays by which plants can be photographed, will not easily pass through water or aluminium, although both water and aluminium are very transparent to the kind of Rontgen-rays used for photographing the bones of the human body. But we cannot decide as yet which sort of Rontgen-ray should be compared to the red, and which to to the blue of ordinary light. This autumn l propose continuing the experiments, ticorge J_{ϵ} Burch, M.A., 21, Norham Road, Oxford. [Other illustrations were kindly forwarded, but they cannot be successfully reproduced. Ed.

ROUGHAM HALL, SUFFOLK.

The beautiful seat of E. J. Johnstone, Esq., has long formed a striking and picturesque object on the highway between Bury St. Edmund's and Stowmarket, about four miles from Bury. For several generations Rougham was famous for the family of Bennets, its peat, and its Rhodo-dendrons. The house near to common and heath, was built by one of the Philip Bennets, who succolded each other here through several generations. The Drurys, a well-known Suffolk family, held this estate before the Bennets, and probably some of the fine timber that still enriches the estate belongs to that early period. Be that as it may, with the advent of the present proprietor great improvements have been effected, alike inside and out, and the mansion and gardens are being furnished and adorned with every modern appliance and convenience regardless of expense; the more recent and largest improvements in the gardens and grounds have been carried out under the direction of Mr. George Paul, the well-known rose grower and accomplished landscape gardener of the Old Nur-cries, Cheshunt, Hertfordshire.

With the exception of its thriving plantations, the chief arboricultural glory of Rougham, has lain in the extreme beauty and enormous numbers of its Rhododendrons. Here through several generations, the Ponticum section of Rhododendrons have grown like weeds, sub-cropping the fine plantations that spreads far and wide from the Hall in the direction of the Rougham station on the Great Eastern line, and lighting up the heath with a glow of colour that delights the eyes of so many travellers in the Rhododendron season.

But special sites for American plants are, as some gardeners rather too strongly express it, seldom good for much else, and hence it was found that the grounds around Rougham Hall (a light sandy peat), was by no means favourable to the growth of Roses and other trees and shrubs, though the district round is emphatically a Rose centre. Hence the bold resolution to give the new rosary near the Hall a favourable start on new soil, and thousands of eart-

loads were removed from the heath to lay a sure and solid foundation of permanent success among the Roses, and other shrubs, trees, and plants around the Hall. For such permanent and lasting improvements, it is just as needful to make proper provision as to lay the foundations of a mansion solidly and well.

In dealing with such demesnes as Rougham, it is of importance to bear in mind that landscapes can be cut out as well as planted. The whole of the large wood proceeding from the Hall across the heath to the station is a happy hunting-ground for objects of beauty and interest for the garden. In not a few cases it was found impossible to see the fine timber for trees, and even the glorious masses of the Rhodedendrons, spreading far and wide in unbroken phalanx, often shut each other out of sight. One of the first wants of old gardens and pleasure - grounds is space for observation. Vast numbers of fine specimen Oaks, Spruces, Thorns, &c., have thus been evolved out of erowded masses, and set in the new light of attractive landscapes. One of the freshest charms of such landscapes is the spontaneity of their evolution; yesterday it was a mass of verdure or other colour, to morrow the masses may be moulded into groups, with bewitching glades between. Thus, through evolution, we may get very many more and better effects in our landscapes. Ideas of distance, grandeur, freedom, as well as variety may be cut out as well as planted in. Only a few touches of taste or flashes of genius, and behold revealed on the instant are the beauties of shrub and tree, of wood and walk, of green vistas or far-away church steeple or tower that may have been hidden for many years. We have seen not a few landscapes transformed by bringing in a winding river, the sight of the sea, the glory of the rising and setting sun, clear peeps into the open face of the sky, a mountain summit, or a far-reaching spread of field or forest, or may be of only Buttercups and Daisies

Rougham has been fortunate in finding a gardenartist in Mr. George Paul, quite as anxious to cut out or show up all the old beauties as to plant the new, and equally well qualified for either. Mr. Johnstone, the proprietor, and his gardener, Mr. Henley, have also thrown themselves with fervour in both directions, and Rougham seems in a fair way of becoming one of the most charming and fairest places in the country of Suffolk, or indeed in the country.

The new rosary is planted with the choicest varieties; and there is also much freshness and variety given to it by the use of considerable variety in form, size, and training, and by surrounding the whole with a Rose hedge. The place was already crowded with thousands and tens of thousands of Rhododendron Poutieum as well as some 400 of the choicest hybrids, and quantities of Kalmias and Azaleas have been planted and edged with hardy Heaths. Quantities of the best shrubs have also been planted, such as Japanese Maples, Magnolias, Pyrus japonica, Syringas, double and single Lilaes, Almonds, Thorns, Woigelas, Laburnums, Cerasus, Deutzias, and many other deciduous shrubs.

For coloured foliage, free use is made of purple Leech, Liquidambar, golden Yews, golden and other Hollies, Elders, Privets, &c., and fine masses of the best varieties of Rhododendron, with borders in front of them for hardy herbaceous and flowering plants and gardens have been made in other parts for other purposes—as, for instance, the Dell garden for early bulbs; the Alpine garden, hardy Fernery, the Rootery, the idea of which is said to have originated with the proprietor and his gardener, all of which are furnished with the best possible material by Mr. Paul, and are rapidly growing into verdure and beauty.

The flower garden and shrubberies cover somewhere about 15 acres, and the green glades and walks are at once spacious and charming; one that starts from near the fernery is 12 feet wide and 100 yards long, and leads off to the left on to a gravel walk 6 feet wide.

Again, proceeding from the hardy fernery, on the right is a green walk 20 feet wide, running round on to the pleasure-ground, and to the Rose-garden. Other walks and lades proceed in various directions, the

object being to provide alluring walks to all the chief points of interest, and also affording a choice of gravel over turf in wet weather. The chief pleasure-grounds lie on rolling ground, the natural levels being mainly preserved. There are some fine views of trees, &c. from the handsome conservatory attached to the mansion, and from this point the mixture of lawn and beauty of flower and shrub have a very remarkable and pleasing effect, while the gravel-walks or green glades allure us to closer fellowship with nature in the woods with their carpet of Rhododendrons. The conservatory was well furnished with Ferns, Palms, Aspidistra, Eucalyptus, Begonias, Pelargoniums, and other flowering-plants.

Great improvements have been made, and many socalled imperishable glasshouses built in the kitchengarden within the last few years. There is a well walled-in garden of about 3 acres, with the inevitable "slips" beyond. The walls are well furnished with admirably trained choice fruit-trees, especially of Pears, Peaches, Plums, Cherries, &c. The vegetables were of the finest varieties, and the highest quality. The kitchen-garden is on the opposite side of the public road to the mansion, flower-garden, and pleasure-grounds, and is situated on a much better kind of soil. Splendid Asparagus and other vegetables grow in it. As an index to the character of the climate and soil, it may be said that a fine border of intermediate Stocks that had stood in the open air all the winter without any protection was in bloom at the end of May last, and that I saw here some of the finest heads of Asparagus that I have seen in Britain, and other vegetables as good.

There were several fine vineries of Muscat, Black Hamburgh, Gros Colmar, Lady Downes, and Alicante—the earliest Muscats being grown in pots—and the early Hamburgh in a house. The Alexandra Peach was also ripe in May. Noblesse Peach, and Pine-apple Nectarines were swelling off fine crops. On shelves at the apex of the houses were seen fine samples of Royal Sovereign Strawberries; and Pines, Melons, and Tomatos were noted.

The plant-houses consist of a plant stove well furuished with fine specimens of exotic Ferns, Palms of choice species, Draesenas, Pandanus Veitchii, Dendrobium nobile, D. Wardianum, &c. The large greenhouse 40 feet long by 20 feet wide, was mainly filled with Carnations, Pelargoniums, and double fimbriated white-blossomed Petimias for cutting. Other smaller houses were furnished with later plants in succession. There were also a fine house of Odontoglossums, and two other Orchid-houses containing a very promising collection. Among the Orchids were some fine Lælias, Cattleyas, Oncidiums, Calanthes, and Cypripediums. The Croton-house contained some finelycoloured specimens of these, and other choice stoveplants. In a word, the utilitarian, as well as the ornamental side of these fine gardens, reflect the highest credit on all concerned in planning and carrying out so successfully the many improvements that have been made. D. T. Fish.

VEGETABLES.

GLOBE ARTICHOKES.

In England Globe Artichokes are comparatively little estcemed, perhaps because the edible portion is found to be tough, or not sufficiently fleshy. This leathery state of the bracts is due to faulty cultivation. Artichoke stools are planted in a part of the garden, and there they remain for ten, twelve, and twenty years! Naturally the stools become large, strong, support cold weather much better than young stuff, give a great quantity of flowers, which appear early in the season; but what is the produce like in quality and flavour? For market purposes it is all right. When once the planting is done, the ground reserved to Artichoke culture requires very fittle labour, and furnishes abundant crops. In private places the gardener does not want large quantities of flowers, a few only, but fine in size, full in flavour, and that is all.

A trial of the following treatment will certainly

realise the private gardener's wishes, the results of the trial being always successful. Artichokes like recently-manured and newly-dug soil. In spring the ground should be trenched to a depth of 24 inches (60 centimètres). Between the trenches should be put a good layer of new horse-litter. A stock of Globe Artichokes, of the variety "Gros vert de Laon" (which unfortunately does not reproduce similar plants from seeds), is then planted at the end of April or beginning of May, according to the weather : a distance of 32 inches (80 centimètres) should be observed between each plant. It is necessary to shade for a few days the newly-planted stuff with a painted bell-glass, a flower-pot, or an inclined tile; a cup is made around each plant in order to facilitate the watering, and assure a good start. These young plants as soon as rooted will grow vigorously, and will give in August and September, sometimes later, voluminous and fleshy flower heads, such as it is impossible to obtain on an old stool. In the middle of the summer, if the weather is dry, it is as well to let the plants rest for a short time, in order to contribute to the formation of the flower. Directly it appears, all the means necessary to favour a strong vegetation and vigorous growth must be employed. such as frequent waterings with manured composition, and stirring the surface of the earth around the plants. The Globe Artichoke, to furnish strong growths, requires to be transplanted every year. In autumn, after the first sharp frost, generally about the end of October or November, all the Artichoke's leaves are cut to a length of 12 to 16 inches (30 to 40 contimètres). Afterwards the whole plants are surrounded with a mound of coalashes, covered with a bed of dry leaves, the Artichokes being sensitive, and subject to disease if the temperature varies much. The next spring, when the sheltering mound is taken off, nice young growths may be found well rooted in the ashes, ready to grow on at once if planted in a suitable place They are easily separated from the old stools, and. planting is performed as before mentioned.

After clearing off the young plants, the ground is levelled, the ashes well spread over the surface, and deeply dug. It is then ready for other crops. Following this simple method, superb heads of Globe Artichokes, good and beautiful, joining the useful to the agreeable, may be obtained. That produce is consequently worthy to figure at table or in the market, where the old stool's production, often of small size and middling value, show a piteous appearance by comparison.

The coal-ashes used in sufficient quantity performs three important functions—1st, they constitute a manure; 2nd, they permit the air to penetrate easily and in sufficient quantity to the bottom of the plants; 3rd, they offer the advantage of not retaining the moisture. Louis tientil, Kew.

[We gave a figure of the Laon Artichoke, which is remarkable for the depth and succulence of its receptacle in our number for Nov. 30, 1895, p. 649, and strongly commend it to our gardeners and to our cooks. Ed.]

RAMBLES IN NORTH WALES.

(Concluded from p. 424)

ONE'S first impressions of Bangor are not likely to be altogether favourable, because there are too many "foolish walls," as the author of the guide-book designates a particular one that shuts out the view at the top of the recreation-ground. Every gate leading into a pasture or a wood is locked; yet the streetdoors of the houses in Upper Bangor are not only left unlocked, but often wide open, with nobody immediately at hand. On our inquiring into this apparent anomaly, we were told that the gates were not locked so much to keep visitors out as to keep the cattle in; and as there is a commendable absence of notices threatening to prosecute trespassers, we accepted the explanation. So far as our experience went, there was no objection to your getting over the wall or the gate, and wandering where you pleased. But perhaps it would be better if there were less freedom, for itinerant Fern-dealers, and visitors combined, are stripping the country of the Ferns. We remarked on the rarity of Ferns in accessible places in the neighbourhood of Bangor, and we were assured that those marauding collectors sent off several hamper-fulls at a time, of such Ferns as Asplenium marinum; and we were offered huge tufts of the Parsley Fern for a penny each at Aber Waterfall. Boys have discovered that they can make money by this means; but common as this Fern is on the mountains of North Wales, it is not inexhaustible. No doubt it is difficult to make such regulations as would prevent the depredations of wholesale collectors and dealers, yet not shut out the comparatively harmless visitor; though, unfortunately, there are destructive visitors. But we must leave the wild flowers, as we wish to say a few words about gardening and cultivated plants. There is some very good gardening around Bangor and Carnaryon, for example

both sides of the Straits in great abundance, and surpassing in dimensions those one usually sees in the neighbourhood of London. We did not visit any of the large and celebrated gardens, of which there are several both in Anglesea and Carnarvonshire, but Mr. Griffith's garden, on a succession of slopes or terraces, offered much of interest, especially to the botanist. The owner has long cultivated a considerable collection of hardy plants, including a selection of the local rarities. Among these is Rosa Wilsoni, only known in a wild state in one spot in the Straits. A variety of the Golden Rod, or perhaps a distinct species (Solidago cambrica, Huds.), from the mountains, had retained its dwarf babit and earlier flowering season after twenty years' cultivation. Associated with the common form, it flowers from April to June, whilst the season for the common form is from July to September. As Soli-

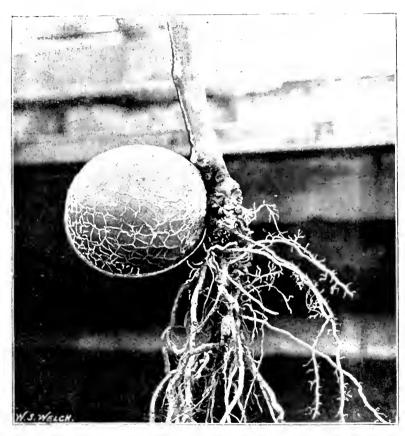

Fig. 89.— a melon developed at the collar of a plant, in the garden of louis thæett, esq.

but there is not nearly enough of it. Judging from our little experience and observation, we should say that these towns are by no means adequately supplied with fresh vegetables and fruit; and there seems room for enterprise in this direction.

One of the things a visitor from the valley of the Thames is likely to envy the dwellers on the Menai Straits is the slightly milder winter they enjoy there. Everywhere there is evidence of this in the fine Fuchsias and Hydrangeas which give so much colour in late summer and autumn to the shrubberies and lawns and cottage gardens. It is true we saw no Fuchsias even approaching in size the famous one at Ramsey, in the Isle of Man (see Gardeners' Chronicle, September, 1886, p. 397, fig. 79); but they are nearly as prominent in Bangor as in the island, forming large permanent bushes full of flower at a season when most shrubs are past their beauty. Unlike most shrubs, too, they continue flowering for a long period,

Escallonias, Myrtles, and Cordylines, though much less commonly planted, appear equally at home. Then there are arboreous Laurels and Sweet Bays on

dagos go. S. cambrica is certainly more easily distinguished than many of the numerous North American forms generally accorded specific rank. Hieracium is another genus largely developed in North Wales, and Mr. Griffith had a collection under cultivation, but they had run together, forming a continuous carpet, and were to be shortly uprocted. Among them were H. villosum, H. murorum var. pulcherrimum, H. cambricum, H. sparsifolium. H. maculatum, H. aurantiacum, and the very distinct II, amplexicaule. More attractive and ornamental were Rumex sanguineus, and a pure white-flowered variety of Galeopsis dubia. The rare Anglesea Helianthemum Breweri, and wild Asparagus from the same county, were also there, as well as an interesting variety of Saxifraga sponhemica, mentioned in Mr. Griffith's Flora as undescribed. Rosa rugosa and Anemone japonica were very fine, the latter being difficult to eradicate, we were told, when once it gets a hold.

But we must cease, for we fear we have little to say that is of general interest. Yet one word more about the "foolish" walls. Though by no means so attractive as living hedges, they often are very attractive, from the crop of Lichens, Mosses, Ferns, and other plants they support. In unfrequented places one came upon square yards covered with Asplenium Trichomanes. There was also a cultivated wall at Portmadoc that particularly attracted our attention, the broad top being nearly covered for many yards with Antirrhinums in great variety and in full flower. Associated with them was Centranthus ruber, also in flower, and a quantity of Wallilowers in seed. IV. B. H.

AN UNUSUAL POSITION OF A MELON.

OUR illustration (fig. 89) exhibits a curious freak observed on a Melon plant this year in the garden of Mr. Louis Tillett, Norwich. A flower formed on the stem close to the ground, and a fine fruit resulted, as will be remarked. It is a most unusual position for a fruit to be produced; and although no shoot is visible in the photograph, it is most in accordance with the habit of the plant to suppose that a very short shoot with a bloom upon it was emitted by the stem.

INDIA.

PAINT USED AGAINST WHITE ANTS.

During a brief visit to the Native State of Gondal the writer (Mr. Gollan), recently gave this subject considerable attention. There seemed to be no doubt that His Highness the Thakore Sahib, by his enlightened action in this matter, had effected a radical improvement. The trees throughout his State were all pointed as described, and not a single tree could be und showing the mind encasements so characteristic of the presence of white ants. And very possibly, as a consequence of the care bestowed on these trees they were healthy and vigorous, while those in neighbouring States were sickly and badly attacked with white ants. The useful ingredients were said to be as follows.—

- I part Dekumali gum (the resin of Gardenia guamifera).
- 2 parts Asafortida. 2 parts Bazar Aloes
- 2 parts castor oil cake

These are well pounded, mixed and kept in water for about a fortnight. When thoroughly united, and what may be call decomposed into a thickened compound, water is added in order to bring it to the consistency of paint, and the colouring matter then added. The mixture is now ready for use, and if thoroughly applied for about 2 feet will check not only the attacks of white ants, but of red ants and other insect pests. Its effect will last for two years or more. The cost of the preparation comes to about 4 to 5 rupees per 100 trees. Report of the Saharanpur Butanic Giardon.

BOTANIC GARDEN PERADENTIA, CEYLON.

To fill the vacancy caused by the ill health we regret we have now to add, the death) of Dr. Trimen, Mr. J. C. Willis has been appointed. Mr. Willis is a complete stranger, even by name, to many botanists and horticulturists, but he will have ample exportanity of making binself known.

VIOLAS AND PELARGONIUMS.—We trust that growers of the ephants will at once respond to the invitation of the Royal Horticultural Society by sending for trial at Chiswick varieties which they deem hest for massing in beds or border. Six plants of each variety should be sent. Readers are referred to p. 75 of the last part of the Journal of the Society (August, 1896) for further directions, and for details concerning other trials to be made. The council have also decided to make a trial next year of zonal Pelargoniums—outdoors, in summer, 1897; indoors, for autumn and winter-blooming, 1897-98. Four plants of each should be sent, two for planting outdoors, two for growing through the summer in pots for autumn and winter-blooming.

GLASS SUBSTITUTES IX GERMANY.

THERE are several substitutes for glass in use in Germany, the chief among them being tectorium, fensterpappe, and hornglas. Tectorium is a sheet of fensterpappe, and hornglas. Tectorium is a sheet of tough, insoluble gum—said to be bichromated gelatin—about one-sixteenth of an inch in thickness, overlying on both sides a web or network of galvanised iron or steel wire, the meshes of which are conceally about the delay of the meshes of which are generally about one-eighth of an square inch. The United States Consul-General at Frankfort says that both surfaces of the tectorium in ordinary use are apparently covered with a varnish of boiled linseed oil, and it feels and smells similar to the oiled-silk that is used in surgery, and for sweat-bands in summer hats. It is lighter than glass of equal thickness, is tough, pliant, and practically indestructible by exposure to rain, wind, hail, or any shock or blow which does not pierce or break the wire web by a violent thrust. It may be bent in any desired form, and fastened in position by crimping, nailing, or with putty like ordinary glass, and when punctured, it may be easily repaired. Its translucence is about the sume as that of opal glass; its colour a greenish amber yellow, which fades gradually to white from exposure to the sun, so that while arresting the direct rays of sunshine, it transmits a soft, modulated light, which is said to be well adapted to hothouses and conservatories. It is a poor conductor of heat and cold, and thus preserves a more equable temperature than glass in rooms containing growing plants. The only objections that can be urged against tectorium are that it is more or less inflammable, and that in very warm weather the outside surface is sometimes softened until dust will adhere to it, but this may be removed by wiping or washing, a service that is usually performed by the rain in exposed situations. Tectorium is an English invention, and Consul-general Mason says that as far as can be ascertained, it is not patented in Germany. It is claimed for it that it has effected an important economy through its immunity from breakage, which, in case of large roofs of glass, are so frequent and so expensive to repair.

ITALY.

PELARGONIUM PELTATUM, Aiton.

This plant is well adapted for growth in hangingbaskets, and also for borders, and for covering the sides of embankments in gardens. I have lately admired such an embankment, about 60 feet long and about 12 feet high, in the gardens of Prince Sepino and of Marquis Spiriti, in Naples. When the Pelargonium is in flower, the wall appears as if it was covered with a pink carpet, here and there sprinkled with some green. The skilful head-gardener, Mr. Giuseppe De Sonca, told me that the plant grows without the least trouble. During the month of March, the small branches are taken off and left in the sun for three or four days, in order to get them quite dried. This is indispensable, owing to the facility with which the plant grows. These branches are then planted at a distance of 4 to 8 inches, leaving them without watering for about a fortnight. this time, and especially if the season is dry, the ground most be watered, in order to keep it constantly damp. After about one month, the embankment will be perfectly covered, and in the middle of May, the plant begins flowering. The flowering sea-on the plant begins flowering. The flowering sea-on lasts till the end of July, and it will attain its highest development, and produce its best effect, from June 15 to July 15.

In the month of January the plant must be cut down in order to avoid a too large development of leaves, and to strengthen it. When frost occurs, the plants may be sheltered with mats, or even with some straw.

In Naples, when the Pelargonium is grown in pots in order to force it, the plants are removed in November to the hot house, which must, however, be well ventilated and moist; and then they must be reported in a mixture of Chestnut-earth, common-earth, and old cow or sheep manure. The plant will then flower about the end of December, or in January.

PROPAGATION OF CAMELLIAS

In the same villa of Prince Sepino and of the Marquis Spiriti, I remarked the way in which Camellias are multiplied by layers. The small plants appeared during the month of July to do very well.

The head-gardener proceeds thus: After having chosen the young branch, he splits it for a length of about 4 inch, in the form of the beak of a flute. The split goes through the half of the branch, and between the two surfaces of the wound a piece of cork is placed in order to keep it open. He then pricks with a penkuife the upper part of the split to facilitate in this way the growth of roots. After having placed the layer in a rather deep pot (fig. 90), he fills the latter with very fine mould from the Chestnut-woods. This way of setting layers widely differs from the usual one. In this way, the end of the upper branch is placed in direct contact with the parent, and perfect success is attained. The Gardenia can be treated in the same way with facility. Dr. Giocanai Mottarcali, Portici, August, 1896.

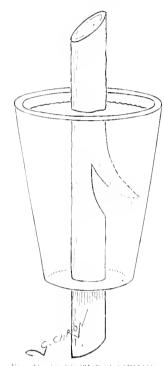

FIG. 20 PROPOSITION OF CAMERIAN.

THE WEEK'S WORK.

THE FLOWER GARDEN.

By Hebley Warken, Gurdener, Aston Clinton, Tring.

Roses.—If much planting has to be done in the rosary, the beds or borders should now be prepared. In some places it is necessary to lift the plants every two or three years, for in some soils, unless this bedone, they die away. If Roses have to be lifted, and they are to be planted again in the same beds, the roots should be laid in whilst the beds are being prepared for their reception. The condition of the soil in the beds will be the best guide to the planter as to the additions required, but in the majority of cases the addition of lime rubble or old mortar, thoroughly decayed manure, and \(\frac{1}{2}\)-inch bones will suffice, deeply trenching the beds and well incorporating the whole together. If this operation be done early in the season, the plants will flower as freely as old-established plants during the forthcoming season. Plants received from the mirrory may be treated similarly. Early planting is especially desirable this season, as the present weather is moist and cool.

General Work.—Continue to plant trees and shrubs whenever the opportunity offers. The sweeping and raking-up of leaves will consume much labour for several weeks, but it should not be neglected. The mowing of the lawns and of the rougher grass in the less-frequented parts of the grounds may now be discontinued, but continue the rolling of turf when the weather permits. Parts of the lawn needing to be re-turfed or levelled should be attended to upon the first favourable opportunity, for all work of this description needs to be done during open weather. The turf near the edges of flower-heds may require attention through having become trodden down or bare. If it be re-levelled or re-turfed, the outline of the beds will be more discernible. The planting of trees and shrubs should be accomplished

as opportunities occur, hearing in mind that good drainage is essential, whether natural or artificial. Little need be done in the shrubberies with the exception of clearing away all weeds, and if Nettles or other quickly-spreading weeds are abundant, fork over the ground, and remove as many roots as possible. Previous to re-gravelling or re-surfacing any walks, they should be cleaned of all weeds to prevent any appearing through the fresh gravel. All walks and drives should be rolled frequently.

THE ORCHID HOUSES.

By W. H. WHITE, Burford, Dorking.

Cattleye-house. - Cattleya Bowringiana is one of the most useful and easily cultivated of all Cattleyas. The plants are now developing their flower-spikes, some of the flowers being already open. The newly-made pseudo-bulbs are producing clusters of young roots from their base; they should be examined to ascertain if they require more root-room. Were the work of re-potting to be delayed until the flowers fade, the roots would then be so numerous and long that they would be damaged during the process. When about to repot well-rooted specimens, carefully break the old pot and take it away piece by piece without disturbing the roots or drainage materials. Prick out as much of the compost as possible, and transfer the plant into a pot a size or two sizes larger. Place around the old roots some clean drainage material, and over this a thin layer of rough sphagnum-moss, and afterwards a compost of the best fibry peat, a small quantity of moss, and plenty of small crocks. Water sparingly, and induce root-activity at the expense of growth as far as is practicable. These remarks also apply to those plants which have done blooming, but have not been reported. Keep the plants well exposed to the Plants of Lælia Perrini should be afforded fresh rooting material immediately they have finished blooming.

Such rare and beautiful hybrids as Cattleya exoniensis, Laclio-Cattleya Canhamiana, L.-C. Arnoldiana, L.-C. eximia, L.-C. Elessensis, L.-C. Phoebe, L. euspatha, and many others that are in full growth, should in the case of large specimens be elevated well up to the roof-glass, and the smaller plants may be suspended from the roof. Until growth is fully made, keep them in the warmest part of the Cattleyahouse. C. eldorado and its varieties should be kept during the winter months in the coelest part of the East Indian-house. They are rooting freely now, but care must be taken not to over-water the plants.

Mexican-house.—Such plants as Lælia anceps, L. albida, L. antumnalis, L. Marriotiana, and others, now producing their flower-spikes, now require very little water at the roots. The night temperature of this house should be kept between 55° and 60°. By day with sun-heat it matters little how high the temperature may rise if plenty of ventilation he given. Lælia Gouldiana being in full growth, should be placed close to the roof-glass of the warm-house. Give copious supplies of water until the flower-spikes appear. L. rubescons (acuminata), now producing spikes from its partially-matured growths, should be equally encouraged.

Schomburgkius.—Plants of Schomburgkia tibicinis, S. Sanderiana, and S. Kimballiana, that are showing spikes, should be kept in the lightest position available in the East India-house, but they must not be watered too freely.

Intermediate-house,—Platyelinis Cobbiana, like P. filiformis and P. uncata, appears to enjoy the cool, moist temperature of this division the whole year round, but P. glumacea prefers the warm atmosphero of the stove during its season of growth. Until such growth commences, keep it in the intermediate-house. Do not over-water plants of Oncidium cheirophorum now that their flowers are advancing, and prevent water from lodging in the axils of the leaves. Masdevallias should be watered very sparingly during dull rainy weather, and the compost should never be made wet to saturation. The atmosphere surrounding them should be rather dry than the reverse, but when fire-heat becomes necessary to keep the temperature to 50°, sufficient moisture must be given to counteract it.

Cool-house. — Odentoglossum coronarium and its variety miniatum, being strong scandent growers, require considerable house-room, and it is a good plan at this period to suspend the plants well up to the light. If the sphagnum-moss on the surface of the compost be in an unsatisfactory condition, it should be removed, and fresh green heads of moss carefully pricked in. Keep the sphagnum-moss growing freely by means of copious waterings.

PLANTS UNDER GLASS.

By JNO. McINTYRE, Gardener, Woodside, Darlington.

Euphorbia (Poinsettia) pulcherrima. — Those examples of Euphorbia pulcherrima which have well-developed bracts may be dotted about in the stove or warm conservatory among the other inmates of these structures, and thus be made to impart a cheerful, fresh-looking appearance to the otherwise uoattractive plant abodes at this season. In order to induce free and healthy growth the plants should not be stuck in ill-lighted positions, but bo afforded places where light falls abundantly. The plants may be supplied at this date with manure-water, the soil in most cases being somewhat exhausted.

Chrysanthenums. - These plants being now brought under glass, should, like the preceding, be afforded all the light possible to bring out the true colours, preserve the foliage, and in the full development of the Never crowd Chrysanthemums together, the result being irreparable injury-a good rule, but often sinned against in places where the glass-house accommodation is limited. Even then, if staging of a permanent kind be at hand, or some temporary staging can be erected with boards and pots, something may be done to avert some of the brought about by crowding the plants. the weather is fine, a good deal of ventilation together with a little fire heat should be afforded to all the houses holding Chrysanthemum. The Japanese varieties finish better if placed in a house by themselves than when mixed with the incurved and other varieties; they are benefited by being afforded more fire heat than those, and some amount of shade during bright sunshine. Moreover, the florets being long and soft, are more susceptible to be injured by damp if the house be kept at too low a temperature. The feeding of the Japanese may be continued till the flowers are partially expanded, when, I think, it is safer to afford water only. Every plant should be carefully examined almost daily to a certain the state of the soil as regards moisture, and never allowing it to become very dry.

Anthuriam Andreauum. — Where plants have become "leggy" the tops should be taken off, placed in spagnum-mess and peat singly in 4-inch pots, and put into the propagating case till rooted; and the stocks should be kept dry, and be given a warm corner in the stove until they break afresh; but this needs only to be done if a larger number of plants is required.

Eucharis grandistora.—Our plants flower twice a year, and if the plants flowered in May, June, or July, and they have made fresh growth, move them into a cooler house, say 50° to 55°, for three or four weeks, just to afford a slight check to growth. At the conclusion of that time, remove the plants to a house having a temperature of 65° to 70°, where they will flower in December.

ticenerias for winter flowering should be stood in a dryish, warm position. Gesneras are sometimes grown in small pots for furnishing purposes, consequently the latter will be filled with roots, making it necessary for the gardener to pay close attention to the matter of affording water. Guard against damp benches and floors, the bloom of Gesneras being easily injured by excess of moisture in the air.

Sidvia spleadens and patens.—These plants, if grown throughout the summer for flowering in the winter, being now in bloom, are valuable adjuncts to Chrysantheniums in brightening the greenhouse and conservatory, or standing in the mansion. Copious doses of liquid-manure and a few degrees extra warmth may be afforded them till the first bloom.

FRUITS UNDER GLASS.

By W. Pope, Gardener, Highelere Castle, Newbury.

Earliest forced Pot Vines.—If ripe new Grapes are required in the month of April, pot-Vines are the most suitable for producing them, and no time should now be lost in getting the Vines into position, in readiness for making a commencement. the best results, a well-heated span or lean-to pit should be provided, along the front of which the pots must be placed on pedestals of brick, stone, or even on large flower pots, and fermenting tree leaves and stable-dung packed round them up to the rims. These materials before being used should have been occasionally turned over to sweeten and get rid of the extreme heat, as care must be taken that the fermenting mass does not exceed 70° orBut little fire-heat will be needed at the first, unless in very cold weather, and a warmth of 55° at night will be sufficient, till the buds have fairly started to grow, when it may be increased to 60°. Let the

canes be suspended in a horizontal position, or with the ends dipping somewhat, retaining them thus till the buds break uniformly the whole length of the canes, and dew them over with the syringe two or three times a day, unless moisture hangs upon them. Should the Vines not have been shortened to the required length, and styptic applied in proper time, it must not now be done, but disbudding done instead after growth has begun. For early forcing no varieties are better than Black Hamburgh and Foster's White Seedling.

Early Vines in Borders.—This vinery having been put into proper order for a start as was directed in my previous Calendar, it may be closed about the middle of November, and a bed or ridge of fermenting material similar to that described above being formed upon a staging of boards along the centre of the inside border, which should be turned on alternate days, and fresh material added as the heat goes down. mass will afford sufficient warmth to start the Vines. Treat the canes like those in pots, lowering the upper end of each till it is level with the front lights. Whenever the weather is fine, syringe the canes twice daily with tepid water, doing this sufficiently early in the afternoon to allow of the wood becoming somewhat dry before nightfall. The proper degree of temperature is 50 to 55°, with an increase of 5° during the day, till the Vines leave broken. Always make use of the sun's heat to as large an extent as possible by closing at 1 or 2 E.M., and avoid high night temperatures. An outside Vine-border should be covered with a thick hed of dry tree-leaves, or Fern, with thatch or shutters over all to throw off rain and snow, and retain the heat in the soil.

Succession-houses.—Push on with the pruning of the Vines as soon as the foliage is off, or as soon as it is seen by the change in colour that it is properly matured. Early pruning is provocative of rest, and for Vines to be successfully started in December, it should not be longer delayed. Clean and dress the rods according to former directions, also remove soured or inert soil, going down to the roots, and apply a dressing of fresh compost; and if the soil of the inside border is dry, it should be well watered.

THE KITCHEN GARDEN.

By Cuvries Herrix, Gardener, Propmore, Maidenhead.

Scakade.—Where very early produce is required, a small number of the callest-planted crowns must now he lifted, and if the soil is very moist, they should be left on the ground for a few days in an exposed place, with all the roots attached, to cause the leaves remaining on them to part readily from the crowns; even slight frosts for a few nights will be found advantageous, as then the crowns when placed in heat start into growth more readily. Growth at this season is sluggish, still very hard forcing must not be resorted to, or the result will be bad. Unless in argent request, the very early forcing of Scakale cannot be recommended.

Rhubarb,—A tew clumps of some early variety of Rhubarb, such as Johnson's St. Martin's, or Hawkes' Champagne, may be lifted and similarly exposed to the Scakale roots. If new plantations of Rhubarb are necessary, the work may be undertaken at this season, the crowns from antumn-planted Rhubarb sturting into growth the following spring as strong, if not stronger, than when planting is performed in February. The ground for Rhubarb should be well manured and deeply trenched, the plant luxuriating in a rich, porous soil. The simple crowns, with roots attached, should be set out in threes triangularly, about 9 inches apart, and the clumps of roots afforded a space of 4 feet from row to row, and 3 feet apart in the rows. A mulch of half-rotten manure should be afforded when the planting is finished.

cilabe Artichakes.—These plants have made much growth during the past month, which, being tender, and liable to injury from frost, it will be advisable to pot up a batch of suckers as reserve stock (see p. 492, present issue). In the event of severe frosts setting in these suckers should be placed in a cold frame, or some other situation where they can be protected.

Turnips, when of a useable size, should be pulled, the tops removed, and the bulbs clamped, otherwise they may become in the event of mild weather, woolly and almost uncatable. Small bulbs from later sowings should be allowed to remain in the soil. Yellow-fleshed Turnips are very hardy, and these and the white-fleshed varieties will continue to grow for some time longer. The larest-grown Turnips will produce useful "Greens" in the spring, if the bulbs be not required, or they are not

large enough for use. To encourage growth, keep the ground between the rows stirred with the Dutch-hoe.

French Beaus.—Late sowings of these plants, which were made in cold pits, will need to be carefully afforded water and air, very little water however being required; but with the best attention French Beans cannot be expected to last much longer in cold pits and frames. Air should only be admitted in favourable weather, the lights being closed early in the afternoon. At night it will be advisable to cover the glass with mats. Beans growing in heated pits will require abundant moisture at the root, and overhead syringing in bright weather, or red-spider will obtain a footing on the leaves; and it is sure to be troublesome if the plants stand near the hotwater-pipes, in spite of every effort made to prevent it.

THE HARDY FRUIT GARDEN.

By G. Woode, Ale, Gordener, Rolleston Hall, Burton-on-Treut.

A List of Varieties of Fracts.—The planting season having arrived, I submit a list of varieties of the various kinds of fruit, which may serve as a guide to some of our readers who intend to plant this year. The varieties I have selected are those that will afford fruit for a considerable length of time, and which thrive in most parts of the country.

Kitchea Apples. — Alfriston, Blenheim Orange Pippin, Beauty of Kent, Bismarck, Byford Wonder, Cellini, Cox's Pomona, Chelmsford Wonder, Duchess of Oblenburgh, Dumelow's Seedling, Ecklinville Pippin, Hambling's Seedling, Frogmore Prolife, Grenadier, Keswick Codlin, Lord Derby, Lane's Prince Albert, Mere de Ménage, Newton Wonder, Northern Greeninz, Pott's Seedling, Peasgood's Nonsuch, Sindringham, Striped Beaufin, The Queen, Tyler's Kernel, Warner's King, and Winter Hawthornden.

Descert Apples.—Allen's Everlasting, Braddick's Nonparcil, Cox's Orange Pipoin, Devonshire Quarrenden, Early Margaret, Fearn's Pippin, Golden Reinette, Irish Peach, Kerry Pippin, King of the Pippins, Mr. Gladstone, Margil, Mannington Pearmain, Ribston Pippin, Rosemary Russet, Scarlet Pearmain, Sturmer Pippin, Worcester Pearmain, Cockle Pippin, and Williams' Favourite.

Dessert Peters, --Beurré Giffard, B. d'Amaulis, B. Hardy, Bergamotte d'Esperen, Comte de Lamy, Doyenné d'Eté, D. du Comice, Easter Beurré, Fondante d'Autonne, Louise Bonne of Jersey, Marie Louise, Marie Benoist, Kuight's Monarch, Ohvier des Serres, Princess, and Williams' Bon Chrétien.

Culinary Pears, - Catillac, Bellissime d'Hiver, Uve lale's St. German, and the Vicar of Winkfield.

Pewhos.—Alexander, Barrington, Dr. Hogg, Dymond, Early Louise, Grosse Mignonne, Hale's Early, Noblesse, Princess of Wales, Koyal George, Violette Hative, and Walburton Admirable.

Netwrines.—Advance, Elruge, Humboldt, Hardwicke Seedling, Lord Napier, Pine-apple, Rivers' Early Orange, and Victoria. It may be said that North of the Humber Peaches and Nectarines should be planted only on south walls, and even on this aspect there are places where ripe fruits are not obtainable, and the wood seldom ripens without the use of artificial heat.

Apricots should consist of Frogmore Early, Breda, Hemskirk, Large Early, Oullin's Early, Peach, and Powell's Late.

Powell's Late.

Culinary Plans are—Archduke, Early Prolific,
Rivers' White and Red Magnum Bonum, Monarch,
Pond's Seedling, Prince Englebert, The Sultan, The
Czur, Denyer's Victoria, and Washington.

Descrt Varieties.—Bryanston Gage, Coe's Golden Drop Denniston's Superb, Green Gage, Jefferson's, Kirke's, Oullin's Golden Gage, Reine Claude de Bavay 'only on warm walls anywhere), Reine Claude Violette, and Transparent Gage.

Bluckberries.—Two good kinds are Iaciniatus, and Wils n Junior.

Cherries.—Belle d'Orleans, Bigarreau, B. Napoleon, Black Eagle, Black Tartarian, Early Purple Gean, Early Red Bigarreau, Elton, Frogmore, Early Bigarreau, Governor Wood, Manmoth, May Duke, Morello, Belle Magnifique, a light red Morello doing excellently as a standard; Reine Hortense, and Werder's Early Black.

Red Carrants.—Cherry Red, Knight's Large, La Constante, La Fertile, Mammoth. Raby Castle, and Red Dutch.

White Curran's, Datch Cut-leaved, and White Versailles.

Black Curran's, +Naples, Carter's Champion, Lee - Prolifie, and Baldwin's Black.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for namina, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations. - The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees. &c. ; but he cannot be responsible for loss or injury.

Local News .- Correspondents will greatly oblige by sending the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be cureful to mark the paragraphs they wish the Editor to see,

EDMUND BOISSIER, who died in A Garden 1885, was well known among Catalogue naturalists as one of the most assiduous and critical botanists of his time. He was a great traveller in Spain, Italy, and in Asia Minor, accumulated large collections, published numerous notes concerning them, and at length

 * Hortus Baissoranus, -- Enumeration des plantes cultivées en 1885 a Valleyres (Vand) et à la Pierrière Chambésy pres Geneve, par Eugene Autran, conservateur del herbier Boissier (Chambesy), et Theophile Durand, conse vateur au jardin Botanique de l'E at a Bruxelles. Préface de M. F. Crépin, Directeur du Jartin Botanique de Bruxelles (Geneva George & Co., S.o., 1890, pp. 371.

co-ordinated those relating to Eastern districts into his excellent and most useful Flora Orientalis. All this is well known to those concerned; what is not so well known even among horticulturists is, that the great botanist took means wherever possible to control and extend his observations on the dried plants of his herbarium by comparison with the living specimens. To this end he collected, at Valleyres, at the foot of the Swiss Jura, a collection of herbaceous and alpiue plants, which has excited the astonishment and stimulated the admiration of those privileged to see them. Visitors to the garden at Valleyres, says M. CRÉPIN, in the preface to this volume, were always struck with astonishment (emerreilles) at the sight of the rockeries, the walls, the beds, which overflowed with a host of plants derived not only from the European Alps, but also from those of Asia and America. Between three and four thousand species and varieties were thus got together. Notices of this garden wifl be found in our volumes for June 28, and September 6, 1890. At Chambésy, near Geneva, Boissier also established an arboretum, the trees of which have now, we believe, been transferred to the estate of M. BARBEY, the sonin-law of Boissier, and one who has bimself achieved a reputation as an eminent botanist. The work before us contains a methodical catalogue of the species and varieties growing in the two collections at the time of Boissier's death. From this list it will be seen that it is not only alpine plants that are cultivated, but other plants as well, such as Cactaceae, Orchidaceae, and bulbous plants generally. Thus there are over seventy species of Mammillaria, as many of Cerous, of Mesembryanthemum, and of Masdevallia, fifty-seven Dendrobiums, fifty Odontoglossums, sixty Oneidiums, sixty species of Allium, and so forth. Altogether some 5,000 species are here classed under their natural orders, with the names of their authors. the place and date of publication, synonyms, illustrations and geographical distribution. In almost all cases, as we are told, the original descriptions have been referred to, so that the errors arising from trusting to compilations and transcriptions have been, as far as possible, avoided, whilst, at the same time, current errors in nomenclature have been rectified in accordance with the rules of priority. No doubt the Index Kewensis has furnished much assistance to the compilers, though much of their work was in type prior to the publication of that monumental work. The work is well printed, and the proofs have been carefully read. An alphabetical index of the genera allows of ready reference to any group required.

The authors have succeeded in preparing one of the best garden catalogues yet issued, and one that will be most serviceable to directors of botanic gardens, and to those cultivators and collectors who take an interest in the history of the plants they cultivate.

It might not be difficult in such a mass of detail to point out an error of commission here or one of omission there, but it would be an ungracious task in the face of the intelligent care and diligent labour that have evidently been expended on this publication.

THE friends and acquaintances of Di Henry Dr. HENRY TRIMEN will receive ${\bf Transition}$ the news of his death with deep sorrow. His modesty, his gentleness, his sympathy, his right-mindedness, his sweetness ef disposition, and readiness to help, were as remarkable as his extensive botanical attain-

ments. Trimen was educated for the medical profession, and took the degree of Bachelor of Medicine at the University of London. Attaching himself particularly to the study of botany, he became an assistant in the Botanical Department of the British Museum; and on the death of our old correspondent, Dr. THWAITES, in 1882, became Director of the Royal Botanic Garden at Peradenyia, Ceylon. That position he filled till compelled recently by ill-health to relinquish his duties.

Dr. TRIMEN first attracted attention by the excellent Flora of Middlesex, prepared by himself in conjunction with Mr. W. THISELTON-DYER, the present Director of the Royal Gardens, Kew. That book has formed the model on which all subsequent county floras have been prepared, and the more closely they have approximated to it, the more valuable has been the result.

During the period of his service in the British Museum, TRIMEN was associated with the late Professor Bentley in the preparation of the standard work on Medical Botany, and also edited the Journal of Botany, in which periodical appeared several critical notices from his pen. On his appointment to the directorship of the beautiful garden at Peradenyia, TRIMEN took up the work left unfinished by THWAITES, and devoted himself to the preparation of a complete flora of the island. Three parts of the Handbook to the Flora of Ceylon have appeared, bringing the work down to the Balanophoracea, so that the work is well advanced, and we trust material may be in hand for its completion. It is accompanied by an atlas of coloured plates of the more interesting species. Not long since TRIMEN visited this country to seek medical assistance, when his friends wero shocked at his condition, and entertained forebodings which the event has only too surely verified. Dr. Thimen died at Peradenyia on the 16 inst., in his 53rd year.

Few plant-anatomists have at-AUGUSTE tained a higher position than did TRÉCUL. AUGUSTE TRÉCUL, whose death at an advanced age is announced. Of late years he published httle, and lod a very retired life, so that he is little known to the modern generation. He is not even mentioned in SACHS' History of Botany, though most of his best work was done before that book was published, and is important enough to find place in any book purporting to be a history of botanical science. TRÉCUL devoted special attention to the development and relations of the vascular system in plants, as well as to the mode of growth of stems and roots, the effects of decortication, the production of gnaurs, and other subjects of interest to cultivators. He studied the minute anatomy of the Nymphieacere, investigated the nature of the perforations in the leaves of some Aroids, e.g., Monstera, and classified the Artocarpaceae. In the early part of his career TRÉCUL travelled on behalf of the French Government in Texas, the Rocky Mountains and Mexico, but some of his collections were lost by shipwreck off the Azores. TRÉCUL was a member of the Academy of Sciences, and died at the age of seventy-eight.

EUPHORBIA A LARGE SPECIMEN OF ABYSSINICA. — The subject of our illustration (fig. 91) is a gigantic specimen of Euphorbia abyssinica, which stood in front of the marble terrace in the gardens of the Marchese HANBURY, at La Mortola, until the present year, when it suc-

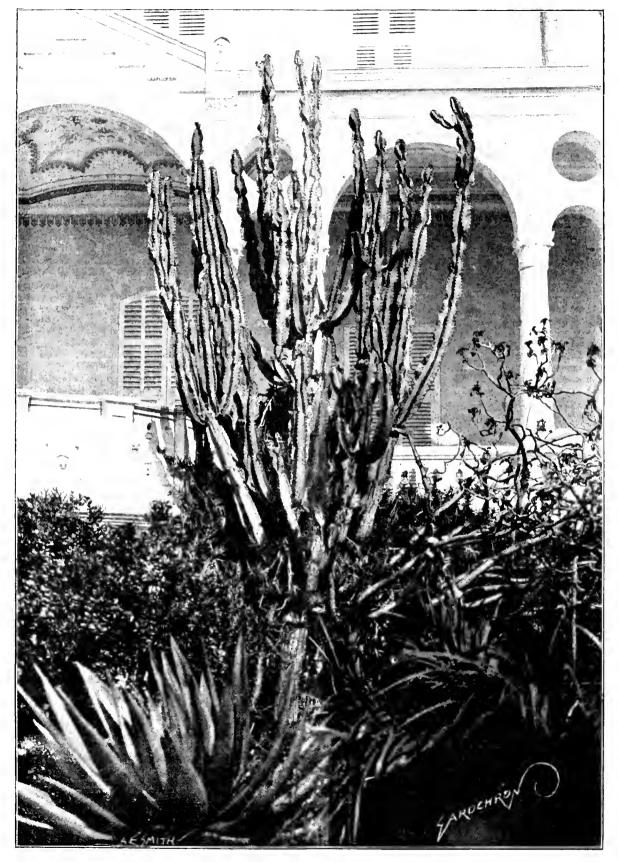

Fig. 91. A line specimen of echnormal abyssinica, grown in the gardens of the marchese handler, at la mortola. (sle p. 496)

cumbed apparently, to cold. The height of the plant as given to us was 19 feet 8 inches, and the circumference of the steen 2} feet. Its age was twenty-nine years, and it was believed to be the largest specimen of its kind in Europe.

TERCENTENARY OF THE POTATO. -- At a meeting of the Irish Gardeners' Association, held at the Sackville Hall, Dublin, on August 26, it was unanimously decided to hold a Conference on the Potato in 1896. With the introduction of the Potato into Ireland, 300 years ago, is associated the name of Sir Walter RALEIGH; and the Irish Gardeners' Association, in celebrating the tercentenary of the event, have done so as a befitting memorial to Raleigh, and at the same time with a view of placing on record the exceptional and remarkable progress that has been made in its subsequent cultivation; and further, in order to attract the notice and command the special attention of all those interested in the cultivation and preservation of this one of the most important of our national foods. The unusually abundant crop of this year affords a favourable opportunity for examining the numerous kinds cultivated throughout the country, and to compare their merits. Not only will hundreds of varieties be available for comparison, but it is proposed to make the Congress instructive and educational. The Conference will not take the form of an ordinary exhibition, as there will be no competition and no prizes. All growers of Potatos are invited to send collections or specimens, and the more numerous these are the greater will be the interest the exhibition will create. It is desirable, therefore, that every collection should be accompanied with as much information as can be furnished with regard to the soil, exposure, and physical conditions of the districts in which they were grown. The committee desires that an effort be made to procure specimens of all the varieties that are grown in the various districts, and that all should be distinctly labelled with the name or names under which they are known in their respective localities. All packages should be addressed to the Secretary, Potato Conference, Rotunda Rooms, Dublin, and must be delivered. carriage free, on or before December 8. Exhibitors staging their own Potatos may do so on the morning of December 9, to be ready for the inspection of the committee by 12 o'clock. Notice of intention to exhibit must be given to Mr. Thomas Shaw, Secretary, not later than December 1, stating the number of varieties to be exhibited, and the amount of space that will be required. The committee trusts, however, that applications for space be sent in as soon as possible to prevent disappointment. The committee of the Irish Gardeners' Association, who have undertaken this Congress, regrets that their funds do not permit seed merchants' or other trade exhibits to be shown free of charge, and they are, therefore, compelled to fix a nominal tariff of 3d, per square foot to such exhibitors, but all specimens or collections sent from amateurs or private growers will be admitted entirely free. Several eminent English and Scotch firms, as well as the Irish seed trade, &c., have already signified their intention to exhibit collections of Potatos, as well as appliances and remedies used for the prevention of Potato diseases. The following papers and lectures have already been promised, and the official programme of the hours when these will be given will be duly announced:-Professor Johnson, D.S.C., F.G.S., Royal College of Science, and Keeper of the Herbarium, Royal Dublin Society: "The Potato Plant, in Health and Disease." Illustrated by microscopic and lime-light views.-Professor E. J. McWeeney, M.A., M.D., M.Ch., &c.: "On Sclerotium Disease of the Potato Plant—its Cause and Prevention," with demonstration of affected plants, specimens of the sclerotium-fungus. lantern slides, and micro-copic preparations —ARTHUR W. SUTTON, Esq., F.R. H.S., of Messrs. SUTTON & SONS, Reading: "The Potato." Illustrated by lantern views, as used on the occasion of his lecture before the Royal Horticultural Society of England, in November, 1895.—Professor Malden, Cardington, Bedfordshire, late Agricultural Superintendent, Royal Dublin Society. "English and Irish Potato Cultivation and Trade.' - Messrs. Dobbie & Co., Rothsay, N.B.; "Twenty-five Years' Experience on Potato Culture in Scotland and South of Eugland."— A. FINDLAY, Esq., Markinch, N.B.: "Remarks on Raising New Varieties of Potates,"-Mr. M. MAGUIRE, Mullin's Cross, Danleer: "Opinions upon the Disease and Cultivation of Potatos in Ireland."-Mr. W. Cotter, Cabra, Dublin: "The Past, Present and Future of the Potate," &c .- Gentlemen who are interested in the cultivation of the Potato, and who are willing to act on the honerary committee, will please notify same to the secretary as early as possible. An official list will be duly announced in the public press. Alfred O. Watkins, President; Robert M'CRAW, Vice-President; JOHN J. EGAN, Treasurer; JOSEPH A. ROCHFORD, JAMES M'DONOUGH, THOMAS Shaw, Secretary, Executive Sub-committee. All communications to be addressed to Mr. THOMAS SHAW, Secretary, Rotunda Rooms, Dublin, where the Exhibition will be held on December 9 and 10.

THE WORSHIPFUL COMPANY OF GARDENERS. —The Members of the Court of the Worshipful Com-

—The Members of the Court of the Worshipful Company of Gardeners, with a few personal friends, were entertained by the Master, Mr. N. N. Sherwood, at a banquet at the Trocadero, now managed by Mr. Lyons, a member of the Court, on Wednesday evening last. At a Court meeting held proviously to the banquet it was decided to offer the freedom of the Company to the Hon. Alicia Amherst, in recognition of her work entitled The History of Gardening in England.

NATIONAL CHRYSANTHEMUM SOCIETY. -We are requested to state, in reference to the great Jubilee Exhibition which is to open at the Royal Aquarium on Tuesday, Nov. 3, with a second competition on Thursday, Nov. 5, that all entries for either show must be sent in to the Secretary, Mr. R. DEAN, Ranelagh Road, Ealing, by Friday, October 30. Everything must be staged ready for the judges by 10.30 A.M. on the mornings of November 3 and 5. All plants shown on November 3, with the exception of the trained specimens in classes 2 and 3, all fruit and vegetables, also all miscellaneous exhibits, must remain until the evening of Friday, November 6. Cut flowers and table decorations can be removed at 10.30 P.M. on the evening of Wednesday, November 4. Strangers exhibiting for the first time are informed that cards for naming cut flowers, and pins for securely fastening them to the stands, can be had at the flower-show office in the Aquarium on the morning of each show. The tables and other parts of the building will be roped off while the judges are making their awards, and only those privileged to be present while the judging is proceeding can be admitted within the enclosures. Exhibitors are requested to make themselves thoroughly acquainted with the "Regulations for Exhibitors," on pp. 55 and 56 of the schedule of prizes.

The Jubilee Banquet will take place in the Whitehall Rooms of the Hotel Metropole, at 6.30 P.M. on the evening of November 3, Sir EDWIN SAUNDERS, the President, in the chair. Tickets one guinea each, which can be had of the secretary. On Thursday, November 5, the exhibition will be largely renewed, as competition will take place in thirty-four additional classes; and immediately after the awards are made, both of November 3 and November 5, a catalogue of the exhibits will be issued, with the names of the prize-winners, which will be on sale in the building. At 7 P.M. on the evening of the 5th a Conference will take place in the library, Mr. T. W. SANDIERS in the chair, when papers will be read by Mr. G. GORDON "On the Types of the Chrysanthemum and their Characteristics, with Suggestions as to the Adoption of a Fuller Classification; " by Mr. NORMAN DAVIS, "On the Points of Quality or Properties of the various Types as Exhibition-flowers, and the Value to be Apportioned to Each;" and by C. E. Shea, Esq., "On Setting-up Blooms for Exhibition, and the Principles upon which an Effective Arrangement of a Stand is Based." The Secretary of the National Chrysanthemum Society offers admission tickets at a considerable reduction in price to parties of not less than twelve persons, members of affiliated Societies; and some of the main lines of railway are affording special facilities for reaching

— The Special Prizes offered by the Trustees of the Veitch Memorial Fund, on November 3, viz., Nos. 19 and 20 on p. 66 of the Schedule of Przies, and which are stated, in error, to be "open"—can be competed for only by amateurs and bond file gardeners. "Amateurs" being defined as including any person not engaged in trade as a dealer in plants or seeds. The Turner Memorial Cup and Prizes, which, by an eversight, are stated to be open to competition by nurserymen only, should have been, and are open to all comers.

- Oct 2I: A meeting of the Floral Committee took place on the above date, Mr. J. BEVAN occupying the chair, when a goodly number of exhibits were staged First-class Certificates were awarded to incurved Rena Dula, bright silvery rose, with silvery reverse, a charming variety of great promise for exhibition purposes; plants with blooms were staged, showing the variety to be of dwarf habit, from Mr. T. S. WARE, Tottenham; to Japanese M. Hoste, white, suffused with delicate blush, very broad petalled, and fine quality; and to Pride of Exmouth, delicate lilac-pink, of fine substance and stont petals, from Mr. W.J. Godfrey, Exmouth; and to Pride of Mudford, a magnificent American variety, the large, full, deep flowers of a brilliant amaranth hue on the surface, with silvery reverse, a splendid exhibition variety from Mr. W. Wells, Earlswood Nurseries, Redhill. Etoile Polaire, from M. E. Calvar, broad-petalled flower of deep pink, flushed with purple, is very promising. So are Miss Muriel Goschen, from Mr. II. J. Jones, a charming shade of yellow, and good full substance; Marjory Kinder, from the same exhibitor, yellow, of a pleasing soft colour; and Antoinette, a large broad-petalled pure white variety from Mr. II. J. JONES, which was commended. A very promising sport from Madame Edonard Rey, pale chestnut with buff reverse from Messrs. Pearson & Sons, Chilwell Nurseries, the committee wished to see again. It was named Nelson, but the committee added the prefex of Lord to distinguish it from the Japanese Anemone bearing the name of Nelson.

Chrysanthemum Society of America desire to offer a special prize of a Gold Medal to the National Chrysanthemum Society to be competed for at the forthcoming Jubilee Meeting. In the event of its acceptance on Monday next by the general committee of the National Chrysanthemum Society, this American Gold Medal, which is of the value of £5, is to be awarded to the best twelve commercial blooms, one variety from any source. To be considered from au American point of view, viz., exhibited in a vase (to be provided by the exhibitor), with not less than 18 iuches of stem, of a pleasing saleable colour, size and substance also to be considered. Further particulars can be obtained of Mr. R. DEAN, the Hon. See, National Chrysanthemum Society.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticoltural Society will be held on Tuesday, Oct. 27, in the Drill Hall, James Street, Victoria Street, Westminster, 1 to 4 r.m. A paper on "Chrysanthemums," by Mr. W. H. Lees, will be read at 3 o'clock.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The committee of the Sandringhun Horticultural Society have forwarded, through Mr. A. Mackellar, the sum of £5 5s. in aid of the funds of this lustitution

CHANGE OF ADDRESS.—The editor of the Journal of Botany, Mr. James Britten, F.L.S., announces that his address is now 126. Keunington Park Real, London, S.E.

DEATH OF MR. L. BOEHMER.—We regret to learn, writes the Japan Gazette, in its issue for September 18, 1896, that Mr. L. BOEHMER, an old resident of Vokohama, who established the firm of BOEHMER & Co., recently died in Germany. Mr. BOEHMER had been in bad health for some years, and left for Europe in the hope that the change would effect an improvement.

SHIRLEY GARDENERS' AND AMATEURS' MU-TUAL IMPROVEMENT ASSOCIATION. - "Pruning Hardy Fruit Trees for Pleasure and Profit," was the title of a paper given by Mr. J. MILES, The Gardens, Portswood House, to a largegathering of the members at the Parish Room, Shirley, Southampton, on the 19th inst. the President, Mr. W. F. G. SPRANGER, C.C., in the chair. Mr. MILES dealt with the subject very fully, illustrating his remarks with examples of good and bad pruning, taken from trees in the district. Summer pruning was also recommended, but from the paper it appeared to be an operation demanding much care and judgment, especially as to the time of starting the pruning, otherwise it meant failure certain and complete. Root-pruning also came in for a share of attention, being strongly recommended. There was a discussion, one member expressing an opinion that the care recommended in root-pruning was not necessary, he as a market gardener having found the rough-and-roady method of chopping off the roots with a spade to answer as well as all the care advised by Mr. MILES. A vote of thanks was most cerdially tendered to Mr. Miles at the close of the discussion, also to the exhibitors, and the president. The exhibition was chiefly of fruit.

EASTBOURNE HORTICULTURAL SOCIETY.—Many of our readers will be interested to know that all notifications from intending exhibitors at the Eastbourne Chrysanthemum Show should be sent to the secretary, Mr. E. A. NEWMAN, not later than Tuesday, October 27, after which date entry fees will be doubled.

MR. JOHN WALKER'S ROOT AND ONION SHOW.—At the annual exhibition, held on Tuesday, October 20, at Thame, some 300 specimen roots and nearly as many bulbs were staged in competition. The Onions, known as "Walker's Exhibition," are a good-sized type of White Spanish, with a finely-rounded base, the premier set of twelve bulbs, exhibited by Mr. A. G. Nichols, Nuncham Park Gardens, being models of shape and bulk. The second prize went to Mr. C. Green, Stanton House Gardens: Mr. R. Lye, Sydmonton Conrt Gardens, third; Mr. W. Mober, Rewley Road, Oxford, fourth. The competition was open to all England. The roots were good for a dry summer, Long Red and Globe Mangels turning the scale at 28 lb.; Swedes averaging 16 lb. per root.

WORM-EATING SLUGS.—The Editor of the Journal of Malacology is still desirous of obtaining living specimens of worm-eating slugs (Testacellie), so as to add to the records he has of the distribution of these animals in the British Isles, and which he hopes to be soon in a position to publish. All communications must be addressed to WILFRED MARK WEBE, "Ellerie," Crescent Road, Brentwood, Essex.

FLORAL DECORATIONS. REAL AND SIMULATED.—The last number of the Revue Horticole did not appear with its wonted punctuality. The reason is now apparent in the numbers of illustrations it lays before its readers of the floral decorations in Paris at the time of the recent visit of the Russian Emperor.

CAUTION.—Mr. A. W. Cowan, New Bridge Street, Blackfriars, desires to caution gardeners and others against a man who, it is alleged, is canvassing for orders and receiving payment in advance, for which he gives receipts in lead pencil. Mr. Cowan has given no authority for such proceedings.

NOVA SCOTIAN APPLES.—Reports from the fruit districts say that "the promise of a magnificent output of Apples places this important branch of agriculture beyond peradventure."

STOCK-TAKING: SEPTEMBER.—It is worth while noting here, as a prelude to the usual matter under this heading, that the lately-issued Inland Revenue Returns for the past parter, whilst recording a falling off to the amount of £364,651 as compared with the same period last year, add the welcome information that the receipts for the six months show an increase of £1,262,921 as compared with months April to September in 1895. This is satisfactory, as are

also the Board of Trade Returns for the month just ended.

THE IMPORTS.

show a grand total of foreign and colonial, £33,111,156, as against £30,618,854 for September, 1895, showing an increase of £2,492,302. Our usual excerpt from the "summary" table is as follows:—

Imports.	1895.	1896.	Difference		
Total value	£ 30,615,574	£ 33,111,155	£ +2,492,302		
(A) Articles of food and drink duty free	10,792,950	11,218,701	+42 (71)		
(B.) Articles of food anddrink dutable	2,009,457	2,282,855	+183,398		
Raw materials for textile manufac- tures	2,023,436	2,586,666	+ 563, 530		
Raw materials for sundry industries and manufactures	1,319,668	4,541,461	+221,793		
(A) Miscellaneous articles	1,140,909	1,155,708	+14,799		
(B.) Parcel Post	69,129	196,991	$\pm 127,861$		

There is but one item of decrease shown here, but many changes are recorded in the items making up the total. The most notable increase is under the head of "manufactured articles," the total being £656,000; textile materials show a gain of £563,000. There was a large increase in cotton imports, equal to £743,000, and this chiefly from the United States. Wool dropped by £212,000. In the imports of food, Indian - corn shows an increase of 2,651,000 cwt.; and Wheat fell off by 2,281,000 cwt., or £497,000-an increase, however, being shown by North America. Flour from the United States shows an increase of 443,000 cwt.; Barley fell 560,000 cwt. Batter went up by £317,000, Denmark heading the list. la sugar, chiefly from Germany, there is an increase of £145,000. Of dutiable articles, Indian tea exhibits a gain of 6,301,000 lb, or £284,000 in value. Currants dropped £105,000 in value; a note for Christmas buyers. Timber and India-rnbber fall off considerably. The nine months of the current year show a total import of £316,368,471, against £303,935,714 in the same period of 1895-or an increase of £12,432,757. In concluding our brief note on imports, we, as usual, draw attention to the figures representing the imports of fruits, roots and vegetables, which are briefly as follows :--

Imports.		Imports. 1895.			Difference.		
Fruits, raw	:		-				
Apples		, bush	240,561	682,735	$\pm 480,374$		
Cherries							
Plums		*1	125, 42	62,545	55,607		
Petra			\$9,191	126,044	+ 115,500		
Grapes			170,011	231,564	4.61, 321		
Unenume	rate 1		-1.68,254	157,224	$\pm 18,970$		
Onions			621,439	703,227	+51,755		
Potatos		ewt	66,104	36,49;	-29,611		
Vegetables, merated	rtw,	unenu- value	£11 (308	£108,807	£4,501		

These statistics, it will be noticed, do not decrease in importance as the years roll on. Coming now to the—

Exports

of British and Irish manufactures, we find the total for the month to be £19,797,080 against £19,461,940 for the same period last year—or a gain of £335,141. The gain is principally in metals and their various manufactures.

ISLE OF WIGHT FRUIT EXHIBITION.—The October monthly meeting of the Isle of Wight Horticaltural Improvement Association took place at the Shanklin Institute on Friday, the 16th inst., when Mr. J. CHEAL, of the firm of Messrs. CHIAL & SONS, CRawley, gave a lecture on "Fruitgrowing," and staged for the public inspection over 100 dishes of Apples and Pears, in addition to dried fruits, and a large and beantiful collection of Dahlias. A good deal of fruit was shown by cultivators residing in the neighbourhood, and some of it was particularly good.

In the absence of Dr. Groves (Chairman of the Association), Mr. J. M. Brown presided at the lecture, and after a few introductory remarks, called upon Mr. Cheal to give his address on fruit-growing, which ho did in a clear and concise manner, making it very interesting and instructive by the aid of blackboard drawings, &c.

NEW PUBLICATIONS.—Experimental Plant Phy siology. By D. T. MACDOUGAL. (New York: HOLT & Co.) New-a-days it is not considered sufficient to tell a student anything, be it the simplest of facts. He must see it, and, as it were, discover it for himself. One of the "experiments" in this book, for instance, bids the student immerse a Cabbage-leaf in water in order that he may see how impervious the epiderm is to water. Nevertheless, the student who carefully works through the hundred or more experiments here described will undoubtedly make himself the possessor of a select and very important amount of knowledge. The account of the experiments necessary to show the influence of light or its absence is incomplete. No mention, so far as we see, is made of the influence of the electric-light. The term 'photosynthesis' is applied to designate the forming of carbohydrates (sugar, starch, &c.) from earbon dioxide and water in leaves or green tissues exposed to sunlight. -The Journal of the Essex Technical Laboratories, No. 22, again affords testimony of the judgment and thoroughness with which technical education is carried out at Chelm-ford. For Beans, superphosphate of lime has proved the best manure, whilst the application of farmyard-dung has not yielded results proportionate to its cost. - Flora Capensis. The second part of the sixth volume has been published by REEVE & Co. It contains a portion of the Amaryllidacese and of the Liliacese elaborated by Mr. Baker. To growers of Cape bulbs, this volume will be of special interest, -Bulletin of the Botanical Department, Jamaica. This number contains, amongst other articles, one on the decreased price of logwood, which is attributed to the felling of immature trees the older ones having been cut down .- Yorkshire College, Leeds, Department of Agriculture Report, 1895-96. The Report states that considerable development took place in new directions, whilst the older-established parts of the work are becoming better known and appreciated. The average attendance on the classes for horticulture has diminished. Practical demonstrations are most useful for the laboriers, who are not sufficiently educated to be able to appreciate the importance of the principles. Dr. CLARK is the lecturer on horticulture and allied subjects. - Bulletin of Miscellaneous Information, Botanic Garden, Grenada, June. From this we learn that Castilloa elastica has fruited for the first time in the garden. Birds are said to be very fond of the pulpy substance in which the seeds are imbedded, and may thus serve to disseminate the plant.-Balletin of Miscellaneous Information, Royal Gardens, Kew. May and June. Botanical enterprise in British Honduras forms the initial article of this number, which has the more importance from the fall in the price of Mahogany, and the necessity of supplying some substitute.-Proceedings of the Agricultural and Horticultural Society of India. The total number of Fellows is 569, and the work consists largely in the introduction and distribution among the Fellows of plants suitable for culture in India. About 60,090 plants were distributed last year.—Entomological Notes for the Young Collector. By W. A. MORLEY. (ELLIOT STOCK) A capital book for boys. We do not understand, however, why all the specific names are spelt with an initial capital in the lists, whilst in the fext a small initial letter is used. The varied practice of natoralists in this matter is becoming very trouble-

CHRYSANTHEMUMS.

THE long-continued showery weather has not been favourable to the perfect development of the blooms. In glass structures, which are not quite waterproof, much trouble will be caused by drip. If the blooms are allowed to remain directly under such drip, the florets will certainly be injured, and the quality of the bloom be much impaired. The blooms mu-t be relieved of any surplus moisture that may have formed upon them, and when it cannot be dislodged by a gentle shake, it may be absorbed by the use of blotting-paper.

Continue to maintain a gentle warmth in the hotwater apparatus, to provoke a circulation of air. Moisture upon the blooms is frequently the result of the blooms having become very cold, and thus induced a condensation. Water must be given the roots very sparingly, and always in the morning, after which the surplus water from the pots should be mopped up. Strong stimulants should also be avoided, as conducive to damping in the blooms; and during the present weather, any stimulant that is given should be first diluted considerably. Shade the plants from bright sun, to obtain perfect colour in the blooms, as well as to preserve them. Much injury is done to opening flowers by sudden exposure to hot sun, especially if it follows several dull days. The manner of arranging the plants in the various structures will have a distinct bearing on the requirements of shade.

In many gardens the Chrysanthemums are flowered in Vineries and Peach-houses, and if the house face south, the plants may still be arrange I with a face to the north. Seldom are all the leaves removed from the Vines or Peach-trees before the Chrysanthemams flower, and sufficient shale is then afforded the plants by the remaining leaves. Should it be desirable to retard any particular bloom, this may be easily done by spreading over it a sheet of thin tissue paper, which should be removed in the evening. Permanent shading during the time the plants are in flower is best and easiest applied by making a mixture of lime and flour in equal proportions of the consistency of paint. This should be applied to the outside of the glass with an ordinary whitewash-brush for a thinner solution may be applied with a syringe, Ep.]. Any decaying leaves should be promptly removed from the plants, as they render the atmosphere less pure. E. Molyneux. =

FRENCH BEANS.

I have never been able to secure a profitable crop of Beans in the months of December and January. The plants grow well enough, but they do not pay for the labour, fuel, and trouble expended on them; at least, that is my experience at Sion. When French Beans are sown in the month of November, when the days are very short, the plants are deficient of roots, and without plenty of roots, growth is poor and pods few. We sometimes say, rather thoughtlessly, that the French Beans may be cultivated with ease all the year round, but very much must necessarily depend on the kind of forcing-house,

the locality of the garden, the time at which the plants are raised; and it is only those cultivators who expect very moderate returns, who will sow the seed at the season named. In foggy and damp, dark weather, the flowers drop wholesale. If the seeds be sown towards the end of the month of December, or later, far better returns may be looked for, which is better than waiting till the first-sown p'an's make a second growth of blooms.

French Beans may be obtained in quantity in midwinter, and at a much less cost, with a small amount of sunshine and daylight, and it is to this fact that I place most importance,

During September and October, if we have good antumn weather, French Beans sown late in July, with only cold frames as a protection, give a late supply, as the pods do not so soon get tough and stringy at this season when allowed to remain on the plant; and if the pods are gathered when of a fair size, they keep in a good condition for a long time, if the stalk end is placed in fresh water in a cool place, with a little charcoal in it to keep it sweet.

I now come to the difficult period, November, December, and January; and to provide for that season at the least amount of expense, the cultivator must do so in September. I am aware some may object, and say, why sow at this season, when seed sown much later will give a crop?

Early French Leans may be sown on a bed or in pots, it being immaterial which, providing there is a minimum top-heat of 69 by night, and 70 by day, and 5° to 8' more when a crop of pods has been secured. A small podding variety should be chosen, as Sion House, Ne Plus Ultra, or Mohawk, sowing thinly, and thinning early so as to obtain sturdy plants. Considerable warmth may be used at the start, and till the plants have formed the third leaf, when it must be reduced, and again raising the temperature in a few weeks time when the flowers appear. The plants mu t be afforded all the light possible, and a depth of soil of about 6 inches, manuring aids being given in the liquid form. If pots are used, those of 7 to 9 inches are large enough, and good crops may be obtained from plants grown in smaller ones; if the pots can be stood on a slight bottomheat so much the better. The chief points are a strong early plant and a free set, and if these be obtained the plants will give pods all through December, if they are afforded water carefully, and kept steadily growing. From plants in beds more pods are obtainable, and it is the best method; but whichever is adopted, a showy early plant should be got. G. Wythes. [Where the electric light is available, it should certainly be tried in the case of French Beans in winter. En 1

HOME CORRESPONDENCE.

THE OUEEN'S CELEBRATION, 1897, AND THE HORTICULTURAL SOCIETY'S TEMPLE London will be visited in June, 1897, by ROYAL crowds anxions to take part in the festivities connected with the Queen's celebration; and it might be a good idea for the Council of the Royal Horticultural Society to embrace such a favourable opportunity to fit in the date of their show with that of the celebration. It may be a little late for Orchids, one of the great features of the show, but no doubt even then a good representative display of these glorious flowers could be obtained. There is little doubt that if the 1897 show could be held in celebration week, it would result in a big financial success-certainly one well worth consideration in view of the many claims upon the Society for the proper prosecution of its important work. May one put in a plea for a more practical recognition of the private gardener at this show? and suggest that good money prizes to offered for the best examples of cultural skill in the culture of plants, flowers, fruits and vegetables. Medals may serve as sufficient acknowledgment to the trade, the latter being amply compensated from the advertiselatter being amply compensated from the advertise-mont point of view; no such consideration, how-ever, enters into the gardener's position, hence the comparative paucity of gardeners exhibits at these shows, and the very undue preponderance and inevitable sameness of trade exhibits. Would not some novel and peculiarly suitable interest be

excited at next year's show were the Council to offer prizes in an open class for the best sixty plants, the last sixty years? Some such restriction as to numbers would be needed, looking at the numerous and wonderful introductions during this period, and it allows for one plant during each year of the reign. As showing, too, the splendid advance made in certain genera, the authorities of the Botanic Gardens scattered throughout the Empire, might be induced to exhibit types of plants or flowers from their respective representative collections that first came cultivation in 1837. Visitors to such a show as the one under notice, have little or no opportunity of inspecting Covent Garden, which has not inaptly been termed the best garden in the world, and, so far as garden produce is concerned, it is sufficiently near the truth for all practical purposes. Why not at the next Temple Show set apart for "market growers" some classes to illustrate what may be called decorative plant culture? In this what may be called the golden age of garden literature, how interesting and instructive would be an exhibition of some of the best books and papers that have seen the light since the Queen ascended the throne in 1837! What magnificent literary advance has been made all round since this time! Or we has been made all round since this time! could go back a few centuries, for as Johnson, in his History of Gardening, tells us, that the author of the first book written on the cultivation of the soil in England was by Walter de Henley, in the reign of Edward III., 1327—1377. In a translation of this work by Elizabeth Lamond (1890), we learn that the carliest edition was the English translation issued by Wynkyn de Worde, immediately followed both in the MS, and the printed copy by a tract on. the planting and grafting of trees, adapted and translated by Palladius. Altogether, the Queen's celebration in 1897 would seem to furnish to the representative Society of British Horticulture a magnificent opportunity for illustrating the progress of the Gentle Art, during a reign that will be memorable from whatever point of view it is regarded. J. B.

- On June 20 next, should Her Majesty be s) long spared, she will complete the full term of sixty years reigning over Great Britain. During that sixty years herticulture has made wonderful strides, indeed it has almost more than kept pace with other professions, vocations, and industries of the kingdom. It is presumably net too late to ask whether it is in any way proposed to celebrate that event, and to show the world that horticulturists event, and to show the world that horticulturists fully realise the wondrous progress of that sixty years of the Victorian era. Were the event to fall in the month of May, then the usual Royal Horticultural Society's Temple Show might have formed a fitting horticultural celebration, assuming that a real effort was made to that end. But the event will be a month later, and assuming there will be a great horticultural festival, it would seem advisable to defer the Temple Show for a few weeks, or else to withhold it for the year, in order to make way for one of a national and representative character on or about June 20. To have a show worthy of the occasion, it is needful that it should, if that he in any way possible, portray the various stages of horticulture from 1837 to 1897, because then there would be tangible evidence furnished of the remarkable development of gardening during the queen's reign. Possibly it will be pleade the suggestion comes too late, and that nothing can be done. I do not assume that such excuse will be made in other directions, where other trades and vocations are concerned. Horticulturists should be only too pleased to have a special opportunity to exhibit to the world at large how fully they appreciate the benefits which the longest reign in British history has brought to them. It is so difficult to realise the immense development of horticulture during the past sixty years, to remember what it was in the thirties, and compare that period with the nineties. Gardening has been growing in every direction all the time, and to many perhaps so in-sensibly that when they come to reflect on all that has been accomplished, they are amazed. The stories as to the decadence of modern gardeners will not bear hearing, when it is remembered what gardening is now, and what it was two generations ago. If then some few men stood out as bright and shining lights, it was because the rank and file were not what they now are. He must indeed be a great man who can in gardening claim to stand head and shoulders above his fellows to day. As years have rolled on, and there has been so wonderful a development of culture as of material, the removal of the duties on glass having worked a revolution in house erection and utility; just as the removal of the paper and advertisement duties has made our fine horticultural press possible. But people to-day can as easily forget—perhaps, indeed, never knew—the difficulties which samptuary laws created for gardeners, as they can the general condition of the country at large, when the Queen began to reign, and which, like to horticulture, too, has undergone a great beneficial change and revolution. It will be interesting to learn how far the suggestion of some exceptional horticultural celebration of the Queen's reign of sixty years be received. It may to some seem simply a loyal suggestion, but to the many it will be regarded as a horticultural one. It is in that sense specially that I submit it. A. D.

RED SPIDER AND XL ALL FUMIGATOR.—Discussing the advantages of this excellent preparation with a Tyneside gardener a few days ago, the fact was clearly demonstrated to me that Messrs. Richards make no mention of red-spider (except by way of eteetera), in particularizing the advantages of their preparation. My friend, whilst admitting its great utility, maintains that it will not kill red-spider in anything like the manner it rids plants of other pests. A Peach-house was given in support of the theory, that having been twice subject to the necessary doses according to the published directions given for the cubic space; other means had to be resorted to, to get rid of the spider. Perhaps some of our large fruit growers will give us their unbiased opinions on this matter. I. I.

RENOVATING VINES .-- If the Grape vines have been on the wane for several years, they should have their roots examined to ascertain the cause, waiting, however, till the crop is consumed or cut, and placed in the Grape-room. If the examination shows the soil is in a sour or much compacted state, the work of lifting the roots, and re-planting them in fresh soil, should at once be undertaken. The soil should have been prepared so that the roots may be lifted and re-planted with rapidity; and as large quantities of manures mixed with the soil tend to sour it, it should in great part be left out of the compost, nutriment being afforded by means of top dressings. When Vines are lifte I early in the autumn, and care is exercised in doing the work, the produce is far better the first year afterwards than it was the previous year, and it will continue to improve if the Vines are not cropped too heavily. A commencement should be made at that part of the border that is fa: thest from the Vine, taking out a deep trench, and shoveling out the soil, always keeping the trench clear for a space of 2 feet in width, thus affording plenty of space to carry out the work of undermining and searching for the roots. Continue to dig out all of these, working along the face of the trench, and in the direction of the stems of the Vines. The roots of the Vines, as they are got out of the soil, should be bundled up in wet litter, and slung up to stakes. Having cleared the soil of the roots, it should be wheeled away, and the drainage put in good order again. It is not prudent to uncover good order again. It is not prindent to uncover many roots at one time, as the period of exposure would be too long, and the Vines might suffer. Having seen to the drainage, proceed to lay turves over it the grass side downwards. Proceed to wheel in the prepared soil, making it firm, and spreading out the roots evenly and at various depths. It is most essential that semi-detached pieces of the roots may be removed if roots be abundant, otherwise they may be left; the broken ends of the roots cut smooth, and at intervals the strongest roots and hare thongs may be notched, to induce the emission of roots. After replanting Vines at a higher level than formerly, to allow for the settling down of the border, a light application of tepid water, and a mulch 3 inches thick of decayed manure, may be put on the border, if it be an outside one. The Vines, treated as above described, should be shaded on sunny days for a few hours, and the vinery kept moderately close. It will also be advisable to wet the Vines three or four times a day, as well as the walls, floor, &c., more or less according to the state of the weather. The Vines will probably soon recover from their root-disturbance, which will show this in a freshening of the foliage; the Vines may then be gradually aired freely. Forcing next year should not begin early, or the Vines hastened overmuch or heavily cropped. H. Markham, Mereworth.

HYBRID GLADIOLI FOR LATE FLOWERING.—During a visit to Linton Park, Kent, on October 2, I noticed some fine pots of these in the conservatory just opening their flowers. Few things would have looked so chaste and pretty as they did, standing on the stage among a quantity of pale-coloured Chrys-

anthemums and other things. Mr. McKenzie said they were potted up several weeks later than the ordinary time for plauting out, and had been kept dry until potted; they looked the picture of health, and were carrying three and four spikes of bloom in 6-inch pots. The red-flewered kinds are just what is wanted at this dull season, when the bright summer flowers are almost over. W. H. Divers.

LATE PEAS .- Some gardeners object to crop the land with late Peas because, as they aver, mildew always destroys them. This is, I dare to say, a valid reason if the earlier varieties of Peas which are not the best for autumn cropping are sown. The Wrinkled Marrows are the best for this purpose; and British Queen, and Ne plus I'ltra, both old varieties, are still the best late Pean providing a stimulus be kept up at the root. These Peas will then form a number of lateral shoots, and they will therefore bear st pping frequently, thus prolonging their bearing. There is no doubt mildew is in a great measure favoured by the torpidity of the roots brought about by dryness accompanied by much sunlight, or by long periods of moist rainy weather accompanied by low temperature. Deep digging is very e sential for success with late Peas, the roots of the plants descending to a much greater depth than is generally believed. Trenches, like those dug out for Celery, should be made 2 feet deep and wide if the soil is good so far from the surface, and this trench should be afforded rotted dung, which when trodden down firmly will be 6 inches thick, over this 6 inches of soil should be returned, doing this at two operations, and affording water to soak the whole mass. Above this there should be placed a second layer of dung, covering this with soil and affording water as before, and filling up to within 6 inches of the surface. This kind of preparation does away with the usual surface-watering. The Peas should be sown in a shullow drill, and covered with a good depth of soil, The Peas should be sown in a a slight mulch, say 2 inches deep, being placed on If these directions are carried each side of the row. out, no water, or but little, will be required by the plants. The sticks used for the varieties of Peas named should be 7 or 8 feet long, and when the haulm reaches to within I foot of the top of the sticks, it should be stopped, for the encouraging of lateral shoots before the energy of the plant becomes reduced by the production of large quantities of ter-The quantity of Peas that may be gathered from a single row thus treated is astonishing. Should the haulm grow so vigorously as to overtop the sticks, it may be again stopped at the points. With these precautions taken, mildew, if it should appear on the plants, will not influence the growth of the plants or greatly hinder. At O berton the soil was very suitable for Pea and Potato cultivation. I was never troubled with mildew on late Peas. The soil was such that I was enabled to grow better vegetables there than anywhere else. Edward Bennett, Queen's Road, Egham.

SOME SUGGESTIONS ABOUT SPRING BEDDING. -It is, I think, rightly believed by many persons competent to form an opinion, that the spring-garden can be made as attractive as the snmmer-garden. only are the materials to the hand of the gardener exceedingly various and capable of lovely combinations, besides affording grateful fragrance, but mankind sees in the revival of Nature from her long winter sleep, much to admire and inspire; moreover, it is so long since out of door flowers were enjoyed, that everyone is glad to have flowers in the place of bare soil. I offer the following suggestions for planting the beds at this season :- A bed of Anemone appenina, the flowers of which are of a bright skyblue tint : planting should be done as soon as the summer bedding is removed. When flowering is passed, lift the tubers and lay them in the reservegarden till foliage has died down, when they should be stored away in sand till required again. A bed of mixed varieties of Anemone coronaria made at this season, and another planting made about one month later. Primula cashmiriana makes a nice bed, if planted in the autumn. It is a comparatively new species, but seed is obtainable of nearly all nurserymen and seeds-men; it should be sown in the spring, and grown in the open air. Primula Sieboldi, if treated similarly te P. cashmiriana, does equally well, and the two form a pleasing contrast; it has succeeded admirably at the Sheffield Botanic Gardens from seedlings raised the previous summer. Dicentra spectabilis is a beautiful early-flowering plant, that requires for its best effects to be brought out in a shady situation; planting in the autumn, or as soon as the plant begins to show signs of returning vitality in the early spring.

A bed of Trollius asiations has a nice effect, but the double-flowered varieties are to be preferred; planting in the autumn when taken up from the beds after flowering, the plants should be carefully divided, and the pieces planted in the reserve-ground. Alyssum saxatile var. compactum strikes readily from cottings in the spring in mild bottom heat, or under a hand-light, in a sandy compost; they are large enough to be used in the beds the following autumn if properly cared for during the growing season. Sanguinaria canadensis, lifted and divide! in the spring, and planted out in the reserve garden till the autumn, should be thinly planted at this season—it spreads freely. There are not many gardens where a few plants of Doronicum caucasicum are not to be There are not many gardens where a found; and when the beds are ready in the autumn, lift and divide (not too severely), and plant the pieces at about I foot apart, care being taken to cut away the old flower-stalks when dividing. Arabis albida from spring-sown seed, furnishes blooming plants for the spring-garden, but I much prefer to lift old plants from the borders or the alpine garden, dividing, and planting in the reserve garden, and planting in the flower-beds at this season. Beds of Narcissus are generally admired, and beds may be planted with the bulbs at this season, putting them out at 9 inches deep, and I foot apart, planting three out at 9 inches deep, and 1 foot apart, planting three bulbs together in each hole, and making very firm. The surface of the bed may be planted with Herniaria glabra, and an edging of Aubrietia purpurea afforded the beds. Any of the early varieties of Narcissus will do, especially N. gracilis. The foliage of these bulbs dies down soon after flowering, and the bulbs do not suffer any check from early lifting. T. Appleby, Botanical Gardens, Sheffield.

ECZEMA CAUSED BY ROMAN HYACINTHS. -Those who have had to do with the unpacking of Hyacinths when received from Holland, even when each bulb is wrapped in paper and packed without Buckwheat husks, have frequently experienced a good deal of skin irritation when they touch any portion of the face with the hands. Many years ago, when I was in one of the large wholesale seed houses, large numbers of Hyacinths used to be handled by me, and always with this result; and it was as true of the ordinary Hyacinths as of those of the Roman type, and in dealing with the various kinds of bulbs I found there was more of this irritation from the Hyacinth bulbs than from any other. It is possible there may be a peculiar irritation coming from the Roman Hyacinths, but it was not perceptible, so far as my experience goes, in any more than in the blues, or reds, or whites. any more than in the bites, of the soil in which almost infinitesimal particles of the soil in which the bulbs had been grown, and attaching themselves to the fingers, were conveyed to the face and neck. I have at times experienced the most acute irritation from this cause. R. D.

DWARF CHRYSANTHEMUMS .- 1 herewith send you (October 12) two Chrysanthemum blooms, one of William Tricker, and one of Mrs. E. S. Trafford, a sport from W. Tricker. The plants have been grown in 6-inch pots, and are 22 inches high. They were struck late in May, and have since been grown by Mr. Milford, gardener to Lady Wilton, Egerton Lodge, Melton Mowbray, who has a batch of similar plants. In Mr. Drover's book on the cultivation of the Chrysanthemum, speaking of Wm. Tricker, he writes:-"Colour a delicate rose; without doubt, one of the finest incurved Japanese varieties of this colour yet sent out; cuttings should be taken the first week in February, and grown on to a height of about Surely, if blooms equal in size to those I send you can be grown without any special cultivation in about six months in 6-inch pots, it must be a decided advantage to have plants so dwarf, and to grow them in such a short space of time, J. Don. [The blooms which were sent with this note were very large and good. This variety, and Mdlle. Therese Rey, and some others, are very easily produced in the manner described above, but they should be thinned to one bud. Ed.].

PLANTING.—It will be wise on the part of all who may purpose planting or re-planting trees and shrubs, to get the work done as speedily as possible. There may be some soils so saturated that it may be well not to be in too much haste; but such cases are few indeed, as, in spite of the recent heavy rainfall, percolation has been rapid, and a dry day or two will soon help to remove traces of the rain. The soil now is in very diverse conditions to what it was in October last year, when unusual heat and drought prevailed. Growth has of late been strong, and wood sappy, so that early lifting will do much good in checking

this exuberance, in causing the woody fibre of the shoots to harden, and conduce to a speedy leaf-fall. The sooner planting takes place, the earlier will new roots be myle, and trees and shrubs become established. There may be cases in which severe prinning of course roots before planting may be needful, but such hard pruning may be counterbalanced in the spring by a free use of the knife above ground. Still, these may be but exceptional cases. Remembering what followed in the winter of 1894-95, when intense frost locked up the soil, and prevented all planting for several weeks, we may be wise to think that severe frosts may, during the eusuing winter, that severe rosts may, during the educing whiter, follow upon the recent heavy rains. No one can tell, but all may conjecture, drawing conclusions from previous seasons. If, therefore, hard weather sets in by-aud-by, stopping all planting operations, how much wiser will have been those who, without necessarily waiting for the fall of the leaf, planted early, and so saved a winter, perhaps a season. Even if the weather once more becomes dry, nothing can so affect the soil as to make it other than eminently fitted as now for planting. A. D.

WHITE AND YELLOW TURNIPS.—The note signed "Albert Upstone" in the Gardeners' Chronicle, p. 498, has caused me to refer to p. 378, where, above the time-honoured initials "D. T. F.," I find the assumption that "it seems as if no one cares to grow white Turnips in Scotland," and an appeal to those beyond the Tweed to give through the pages of the Gardeners' Chronicle the reason why. This seems to call "Albert Upstone" to the front to represent Scotland, and he apparently does so to his own satisfaction by swallowing "D. T. F.'s" assumption, and giving an hypothesis in place of a real answer. Is there none amongst the thousands of bright lads in garden-bothy or seed warehouses in Scotland who will take the trouble to give "D. T. F." the answer which would be so easy to them 'Though I now write from England, amongst one of the things "thought on "by me is white "neeps," so toothsome and good, which I have no hopes of ever seeing equalled here [?]. Will some experienced Scotch cultivator living in Scotland, afford "D. T. F." information about white "neeps," how much they are grown and prized, and at which season they are good! Scot.

DELPHINIUM ZALIL (D. sulphurcum).—I am much obliged to Mr. Reuthe and Mr. M. Cuthbertson (p. 468), for so kindly replying to my enquiry regarding the perennial nature of this pretty Larkspur. Mr. Reuthe's experience leads me to think it may be worth while to try it again, although that of Mr. Cuthbertson is unfavourable. The excessively moist winter of 1895-96 may have had something to do with the loss of my plants. My garden is only some 25 feet above the mean sea-level, so that the climate more nearly corresponds to that of Mr. Cuthbertson's nursery than that of gardens close to Dumfries. I did not suggest, however, that it was of annual but biennial habit. I think it is possible that it may help to give us new shades of colour in this charming genus of plants. S. Arnott, Cutsethorn, by Dumfries, N. B.

SWEET PEA CUPID. -Permit me to add one more to the adverse opinions of this Sweet Pea for outdoor culture. Here, also, it has proved quite useless for this purpose. I daresay there are some who think a Sweet Pea of such dwarf habit is not needed for our gardens. I do not share this view, as it appears to me that there are many purposes for which a free-flowering, non-climbing, and dwarf Sweet Pea could be used to advantage. Cupid, it is to be feared, will not meet the objects in view. S. Arnott, Carsethorn, Dumfrics, N.B.

PRECOCIOUS BUSHES OF CHOISYA TERNATA, ETC.—As instances of the hot and dry season, much too dry as we know to our cost, hushes of Choisya ternata are again in flower for the second time this season. A Black Hamburgh Vine growing on the side of my house, east aspect, has ripened a few dozen bunches of fruit. James Baxter, Boldre Gardens, Lymington.

GRAPES AT THE CRYSTAL PALACE.—My name having been mentioned by my frieud, "R. M., Newbury," in his communication (see p. 468), allow me to state that not only was my employer, the late Mr. Hargreaves, as well as all his family, particularly partial to Gros Colmar Grape, but the visitors to Maiden Erlegh were full of their praises of this variety; and had I grown it to the exclusion of all other Grapes for late consumption, it would have given greater satisfaction than Lady Downes and Black Alicante, which

followed it, neither of which was liked because of the thickness of the skiu. Like "A. D.," I was not a little surprised to see Gros Maroc and Gros Colmar classed together; and I can endorse all that he says concerning the merits of these varieties. The cultural requirements of the two are so different, I should not be surprised to learn that Gros Colmar was quite unfit to eat when grown in a temperature that suited Gros Maroc, the former not only requiring a much higher temperature but also three months' longer time, in order to ripen thoroughly, when in my opinion it more than compensates for the extra cost of firing. Gros Colmar thus grown is useful from December onwards. I unhesitatingly say that no other black Grape is so delicious. "Vinitor" should, I thick, have been fully acquainted with the culture required by Gros Colmar before he so unbesitatingly classed it among worthless varieties. It would be interesting if some of the principal fruiterers in Covent Garden would kindly afford readers of the Gardeners' Chronicle their opinion of the two Grapes in question. I have always understood that the fine Colmars sent from Clovenfords are of splendid quality; and, on the contrary, a friend told me a few years ago that in Covent Garden a fruiterer said that Gros Maroc was never asked for a second time. T. Turton.

ASTER ERICOIDES.—This little gem is in full flower just now, and a pretty sight it makes, with its multitude of miniature star-like flowers. Here, in Perthshire, we find it so oseful that we flower it in pots. Our mode of procedure is as follows: the old plants are taken up and divided in the spring into single stems, with roots attached, and potted in 3-inch flower-pots. When established the tops are pinched, add the plants are grown cool, and planted outside in May, at 4 feet apart. At the end of the month of September they are lifted and potted in 10-inch pots, and stood in a cool Peach-house to flower. The plants are about 30 inches high, and 3 to 4 feet in diameter. The flowers are white, with a yellow centre. We find them very useful for cutting, being light and graceful, and capable of standing a long time in water. A. Morlon.

BEET.—Will you allow a Scotsman resident in this country to comment on the question put by "D. T. F." on p. 378 of the Gardeners' Chronicle as follows, "Why they (the Scotsmen) all grow Carrotrooted instead of Turnip-rooted Beet!" This inquiry, it seems to me, would lead Scotsmen to infer as a natural sequence that in England it was quite the exception to grow the normal form, or, as "D. T. F." calls it, the Carrot-rooted. Instead of this, however, I quote the following figures: The English firm with which I am connected sold last season over 9000 packets of the ordinary long forms of Beet, and fewer than 650 of the Turnip-rooted. Res ipsa logicalized.

FORESTRY,

TREE-GROWTII.

THE partial development of the annual shoots in trees deprived of their bark, which was referred to by correspondents of the therdeners' Chronicle of August 29 and September 5, is only one of several interesting facts which are to be seen in trees which, either from accident or design, are in a more or less unnatural condition. The phenomenon above referred to proves that the course taken by the crude sap in its ascent from the roots to the leaves, takes place through the sap-wood of the stem. The growth of the shoots on the barked trees is in no way more remarkable than it would have been had the bark remained on. The generally-accepted view of the growth of a tree is, that the watery sap rises through the outer rings of the stem into the leaves, there becomes greatly changed, and passes from the leaves through special vessels in the past of miles of dewnward direction, from which it finds its way as through special vessels in the bast or inner bark in a required to the cambium or growing layers. The removal of the bark, therefore, if not carried too far, does not interfere directly with the growth and support of the leaves, but prevents the food which they prepare being put to its proper use by the destruction of the conducting channels and the cam-bium layer. The continuation of growth in the annual shoots under such circumstances depends upon the capability of the stem to retain its waterconducting power, and the amount of reserve material contained in the roots (a part of the stem below the portion barked), by which they are able to carry

on their absorptive functions. In the case of trees barked up to their smallest branches and twigs, the water-conducting power of the upper parts of the stem is soon lost, or reduced below the needs of the leaves, owing to outer influences, such as sun and wind carrying off most of the sap by evaporation before it reaches the growing shoots. Where large branches are ringed at their bases, however, so that at least a part of the bark of the crown remains connected with the roots, their growth proceeds for many years with little or no decrease of vigour or heaith, and only ceases when the decay of the barked portion cuts off the sapply of sap. The growth of the roots of trees barked at the surface of the ground usually continues for one or two years after barking, though whether this is entirely due to the store of reserve materials in the fleshy part of the cortical tissue, or partly to root-grafting upon neighbouring trees, it is difficult to say. Branches of Scots Pine and Larch may be frequently seen with their bases completely isolated from the bulk of the stembank by the nibbling of squirrels, and these branches continue to grow and furuish materials for a growth of new wood, which each year covers a fresh portion of the barked stem; and in cases where the injury is slight, eventually again forms a connection with the main body. In all cases of this kind a great deal depends upon the nature of the wood of the tree, and the course taken by the sap under normal conditions. According to some authorities, the rise of the sap is confined to one or two years'-eld rings in certain species, while in others as many as five or six are concerned in the business. In the latter the sap ascent would probably be continued for several years by the wood to decay would also exert its influence. In resinous Conifers, the saturation of the wood on the outside of the barked stem with resin, which occurs when the cells and cell-walls lose their acts as a protection against the cracking and drying of the stein by atmospheric conditions, and its infection by fungi. Another interesting feature of the vitality of woody tissue is the throwing out of adventitious shoots or "water-branches" by tree-trunks felled in winter, and left lying with the bark on. Elm, Oak, Poplar, Willow, &c., on damp ground, continue growing in this way for two or three years, and the dwarf shoots on young Larch stems and branches left on the ground also develop and keep green for a month or two. Of course, such growths are entirely dependent upon the reserve materials in the sap wood and inner bark, and the increase in the wood-ring which accompanies them is almost nil. These growths, however, are of some economic importance, as they are the means of removing the sap and starchy compounds from the timber, which indirectly do so much to hasten its decay; and it may be that the reputation of winter-felled timber is partly due to this fact. Another rather curious freak in felled trees may also be noticed here. If Larch be felled in late summer, and the branches trimmed off, the stems do not cease growing, as might naturally be supposed, but considerable additions are usually made to the wood-ring after all connection with roots and leaves has ceased. At the edges of the cut surfaces, where branches have been removed, or at the butt end of the tree, new growth may be seen being pushed out in exactly the same way as when a living branch is removed from a standing tree in June or July. This growth, however, does not appear to be a direct continuation of that made previous to felling, for a few days' interval apparently elapses between the felling and its commencement. But the most curious part of the affair is, that whereas under normal conditions the growth of the weod-ring ceases on an average at the end of August, this abgrowth continues throughout September into October, and in some cases is resumed in the following spring. The same growth also occurs in the root-stock, and is evidently due to some disturbance of the relations between leaf and stem, although the precise explanation must be left to the plant-physiologist. So far, we are not acquainted with any other species in which this kind of growth takes place with the same frequency, and to so marked a degree. A. C. Forbes.

SHIRLEY POPPY.—Dr. PRAIN reports, according to the Kew Bulletin, p. 126, that the Shirley Poppy, Papaver Rhacas var. latifolia, has been in continuous cultivation in Scotland for over half a century. It is the P. Hookeri of Baker, Bot. May., t. 6729. The ultimate production of a "variety" by carefully repeated selection is thus shown to be possible, for no question can be entertained of the accuracy of Mr. Wilks' experiments.

POTATOS.

Prices have advanced since last report. Dunbar Main Crops, 95s. to 100s.; do. Bruce, 80s. to 90s.; Lincoln Main Crops, 75s. to 80s. : Blacklands firm at 50s. Very few parcels coming free from disease. Supplies short, and good demand for best samples, J. B. Thomas.

SEEDS.

London: October 21. — Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that the demand for Red Clover seed, has this week quieted down somewhat; nevertheless prices all round exhibit extreme firmness. In White Clover seed, an advance has recently been established of fully £4 p.r ton. Alsike keeps steady; but Trefoil is for the moment a dead letter. For fermion, Italian, 1 franc per bale more money is asked. LONDON: October 21. - Messrs. John Shaw & Sons, Seed foreign, Italian, 1 franc per bale more money is asked. Win er Tares are neglected, but Ryc is wanted. Wisconsin Green Rolling Peas come dearer from America; the English demand for them increases daily, whilst supplies both here and on the other side, ar getting low. Haricot Beans are strong. Some new white Runners have just arrived. There is no change in Hemp-seed. The steamship "Etan" arrived in the Thames this morning, bringing 9,500 bags of new Turkish Canary-seed. Mustard and Rape-seed fim.

FRUIT AND VEGETABLES.

Liverpool: October 21.—Average of prices at the following markets:—St. John's: Potatos, 8d. to 10d. per peck; Cucuunbers, 6d. to 8d. each; Grapes, home, 1s. to 2s. 6d. per pound do., foreign, 6d. to 8d. do.; Pines, English, 4s. to 7s. each. do., foreign, 6d. to 8d. do.; Pines, English, 4s. to 7s. each. Birkenhead:—Potatos, 6d. to 8d. per peck; Cucumbers, 4d. to 6d. cach; Grapes, home, 2s. to 3s. 6d. per pound; do., foreign, 4d. to 9d. do.; Pines, English, 4s. to 8s. each. North Hay:—Turnips, 20s. to 22s. per ton; Potatos, English Regents and Giants, 2s. to 2s. 2d. per ewt.; Main Crop, 2s. 6d. to 3s. 6d. do.; Sutton's Abundance, 2s. to 2s. 3d. do.; Bruce, 2s. 2d. to 2s. 8d. do.; Graftons, 2s. to 2s. 2d. do.; Turnips, 6d. to 8d. per dozen bunches; Swedes, 1s. 4d. to 1s. 6d. per ewt.; Carrots, 12 bunches, 7d. to 5d.; do., 2s. 9d. to 3s. 6d. per ewt.; Onions, English, 5s. to 5s. 4d. per ewt.; do., foreign, 2s. 9d. to 3s. do.; Parsley, 4d. to 6d. per dozen bunches; Cauliflowers, 8d. to 1s. 8d. per dozen; Cabbages, 8d. to 10d. do.; Celery, 10d. to 2s. do.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Daydegrees—a "Daydegree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Seotland N. Principal Wheat-producing Districts—
1, Seotland, E.; 2, England, N.E.; 3, England, E.;
4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts — 6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The Iollowing summary record of the weather throughout the British Islands for the week ending October 17, is furnished from the Meteorological Office :- "The weather during this week was much tiner than for

some time past over Ireland and Scotland, but was again very unsettled and rainy over England. Snow and sleet-showers were experienced in Sectland and the north of showers were experienced in Seatland and the north of England on the 11th. A sharp thunderstorm occurred over the east of England during the early morning of the 14th, accompanied by heavy hall. At Bungay the storm was of exceptional severity, and the hailstones extremely large.

"The temperature was below the mean, the deficit ranging from 2" in 'England, E.,' to 4" or 5" in most of the western and northern districts, and to 6" in 'Scotland, W.' The highest of the maxima which were recorded either on the

and northern districts, and to 6° in 'Scotland, W.' The highest of the maxima, which were recorded either on the 14th or 15th, ranged from 62° in 'Scotland, E.,' and 60° in 'England, S.,' to 55° in 'Ireland, S' and 'Scotland, W.' The lowest of the minima were registered on the 11th or 12th, when the thermometer fell to 24° in 'Scotland, E.,' 25° in 'Scotland, W' and 'England, S.W.,' 25° in 'Scotland, N.,' to 28° or 29° in Ireland, and to 30° in the 'Midland Counties'; elsewhere, the minima ranged from 33° in 'England, N. E.,' to 38° in the 'Channel Islands,'

"The rainfall was greatly in excess of the me n in the

"The rainfall was greatly in excess of the me n in the north-east and east of England, and slightly so in the 'Mid-land Counties' and 'England, S.;' in all other parts of the

kingdom, however, there was a delicit, that in the north and west of Scotland, and in the south of Ireland, being very marked. In some parts of 'England, N.E. the rain was very heavy and persistent; at Almeick Castle the total fall for the week amounted to 4.18 inches.

"The bright sunshine was considerably in excess of the mean in Ireland, 'England, N.W.,' and 'Scotland, W.,' and to a slight extent in 'Scotland, N.;' elsewhere, there was again a deficiency, especially over sonthern, central, and eastern England. The percentage of the possible duration ranged from 48 in 'Ireland, N.,' 43 in 'Ireland, S.,' and 40 in 'Scotland, W.,' to 20 in the 'Midland Counties,' 15 in 'England, S.,' and 9 in 'England, E.'"

Apples for Keeping: C,J. The fruit room or store should be well aired day and night for four weeks after gathering is concluded, and afterwards kept close and dark. If it is found that moisture collects on the fruit, the door and windows should be opened on a dry day for a few hours. The best kind of Apple-room should be partly under ground, and provided with double walls and doors, an earthen floor, and a thick thatched roof.

Apples of Large Size: X. All communications sent to this office, whether for publication or otherwise, should bear the name of the sender. reply to your query regarding large sized Apples, we find records of fruits which weighed more than the one to which you draw our attention. Thus in Gardeners' Chroniele, for October 7, 1893, there are particulars given of a fruit of Peasgood's Nonsuch, grown by Mr. Bannister, which weighed 1 lb. 12 oz. In 1888, Mr. Robt, Smith, exhibited a fruit of Warner's King in October at the Ledbury show which weighed 2 lb. In the Gardeners' Chronicle, November 6, are particulars of a fruit of Mère de Ménage weighing 26 oz. Nevertheless, the fruit of Roundway Magnum Bonum grown by Mr. Farrart, gr. to Mr. Marcus Brown Westhead, Lea Castle, Kidderminster, is a remarkable one. In the paper you send the fruit is described as weighing 26 oz., and as being one of several fine fruits produced by a tree in a 10-inch pot.

BACK WALL OF GREENHOUSE: J. T. boarded wall would do admirably for the back-wall. The distance apart of the two walls would be the thickness of the timber uprights, say 6 inches would suffice. These uprights should be inserted 3 feet deep in the soil, and at a distance of 5 feet apart; and a concrete or brick-wall of 9 inches in thickness, should be built up between the uprights to about 1 foot above the ground level, for if this be not done, the lowest part of the woodwork would soon decay. That portion of the uprights which enters the soil may be crossoted. If a wall be not built, an oaken board should rest on or in the soil of the outer wall. Weather-boarding nailed on to the uprights horizontally, should be placed on the outside; and on the inside the placed on the outside; and on the inside the boards should be placed perpendicularly edge to edge, fastening them to cross-rails morticed into the uprights. The outside may be tarred, and whilst the tar is most it should be sprinkled with quicklime and white sand, which has a good appearance, and endures for a number of years. Lime wash or anti-corrosion paint will answer for the interior parts of the house. The weather-boarding may be cut from home-grown stuff, say, Scots Fir or white Pine; the inside wall may be of the latter. The width should be about 7 inches, and the boards should be obtained of the proper length at the saw-mills.

COLONIAL SEEDS: A. F. We have not published any article similar to the one in the Times, to which our attention is called—at any rate, not in recent years.

Correction: Chrysanthemum Golden Sheaf, noticed at the last meeting of the Royal Horticultural Society, was shown by Mr. E. H. Jenkins, Hampton

GRAFTING THE TOMATO ON THE POTATO: F. P. The operation has often been 'performed, and an example of this kind of grafting was sent to this office in the past summer, which showed ripe Tomato fruits, and small tubers on the roots. It does not seem to be worth the doing, except for scientific purposes, seeing that the fruits and tubers are abnormally small.

GOOSEBERRY LONDON: Hochville. This very large, red-coloured, somewhat inferior flavoured variety, was raised by Banks in the first half of the present century. Fruits were shown at Chester in 1839 of the weight of 29 scruples; and in 1842, at Thatto Heath, of 31 scruples 13 grains. It has been known to reach a weight of 35 scruples.

GRAPES AND VINE SHOOTS DISEASED: J. E. The plants are attacked by a fungoid disease called Anthraenose," or "speck." Strong nitrogenous manures should be avoided, and the plants should be pinched back and kept very open for a season, so as to leave every part exposed to air and light. Cut away and burn all dead or badly-diseased parts, and wash the spotted branches once a fortnight with a 10 per cent solution of paraffin in water and a little soft-sonp. G. M.

Hydrangeas: Enquirer. The most satisfactory manure for these plants, according to Hoffmann, is a mixture of sulphate of annuous with half its weight of phosphate of potash. Of this mixture, 5 grammes were dissolved in a litre of water, with which the plants were watered once a week.

NAMES OF FRUITS.

NAMES OF FRUITS.

* The application to name flowers, and especially fruits, are so numerous at this season, as weerely to the one resources. They entail an expendence of time, lebour, and money, of which one renders have little blue. We are most desirous to oblige over correspondents as far as we can, but we must rejuest that then well observe the rule that not more than six varieties be suit at any one time. The specimens should be good oms, just approaching cipiuss, and to proved disappointment, they should be properly authorized, and confullingweeks. We do not undetake to send answers through the post. Delay in any case is margidable. is anavoidable.

J. Henderson. Without shoots and foliage it is difficult to name Grapes, yours may be Lady Hutt or Mrs. Pearson.—X, no name. Probably Barbatossa.—A. G. B.—1, Fearn's Pippin; 2, Dumelow's Seedling; 3, Cox's Orange; 4, a cider Apple, surely; 5, Ribston Pippin; 6, Northern Greening; 7, Dumelow's Seedling.—Cromarty. 1, Beurre Diel; 2, Beurré Bosc; 3, Hacon's Incomparable; 4, Flemish Beauty; 5, Williams' Bon Chrétien: highly creditable examples from a district so far highly creditable examples from a district so far north.—J. B. 1, Beurré Rance; 2, Beurré Diel; 3 and 4, Bishop's Thumb; R. T. 1, Duchesse d'Angoulème; 2, Josephine de Malines; 3, Beurré Superfin; 4, Baronne de Mello; 5, handsome, but worthless; 6, King of the Pippins; William C., Battle Abbeg. 1, Peasgood's Nonsuch; 2, Tom Putt; 3, Cellini(!); 4, Lord Grosvenor; 5, not known; 6, Putch Codlin.—C. B. 1, Small's Admirable; 2, not known; 3 Hoary Morning; 4. Brabant Belletleur; 5 over rine—probably Beurré Brabant Belletleur; 5, over ripe—probably Beurré Superfin; 6, Marcchal de la Cour.—C. F., Taor. 1, Beurré Clairgeau; 2, Doyenné Blanc; 3, Nouveau Poiteau.—J. T. B. Similar to Lord Lennox. Beurré Clargeau; 2, Doyenne Blanc; 3, Nouveau Poiteau,—J. T. W. Similar to Lord Lennox. P. M. G. Your Pear is Beurré Bose, a well known variety, much grown around London. It is of French origin; should succeed with you against a wall. 1, Apples, the small one is Summer Thorle; 2, not recognised, but excellent.—J. M. B. 1, Golden Noble?; 2, Alfriston; 3, Noble?; 2, Alfriston; 3, Noble?; 2, Alfriston; 3, Noble?; 2, Alfriston; 3, Noble?; 3, Noble?; 4, Alfriston; 3, Noble?; 5, Alfriston; 3, Noble?; 5, Alfriston; 3, Noble?; 5, Alfriston; 6, Alfriston; 6, Alfriston; 6, Alfriston; 7, Alfriston; 8, Alfris J. M. B. 1, Golden Noble 7; 2, Alfriston; 3, Reinette du Canada; 4, Blenheim Orange; 5, Claygate Pearmain; 6, Old Nonpareil.—R. tirindroid. Pears: 1, Alexandre Lambre; 2, Emile d'Héyst; 3, Glou Morçeau; 4, Winter Crassane. Apples not recognised.—J. II. 1, Beurré Rauce; 2, Bergamotte d'Esperen; 3, Duchesse d'Augouleme; 4, Winter Crassane. 4, Winter Crassane; 5, Shobden Court: 6, Apple not known. – B. R. & Co. Apple: Striped Beefing. A. Chapman. 1, Emperor Alexander; 2, Hollandbury; 3, The Queen; 4, Besspool; 5, Pears, Doyenné Gris : 6, Winter Crassane.-H. H., Cater Plum: Poupart's.—Sir C. S. Apple greatly resembles what is known here as Yorkshire Beauty, Pear: Comte de Lamy.— E. Hotwater.—The Apple you send seems to be distinct; probably a good kitchen sort, but not attractive.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number. — J. Howard. Salix incana Oxford. The numbers were detached, and we can not tell to which specimens they applied. The red Passion flower is Passiflora racemosa; 2, Tacsonia exoniensis; Nephrolepis tuberosa (the Fern); Colocasia antiquorum, often called Alocasia violacea; Heterocentron rosenm (the Stove plant); the grass is Panieum capillare. — W. P., Epping.
Daphne gnidium. A. M. D. Physostegia imbricata. — Cigur-bax. X. Seraphyta multiflora, Fisch. et Mey. (Epidendrum diffusum, Sw.). R.A.R.-J. IV. Sequoia (Taxodium) sempervirens.—T. D. Crategus Pyracantha var. Lalandei, Aristolochia elegans, Mast., Gurdeners' Chronicle, Sept. 5, p. 301,

woodeut.— J. C. Phytolaeca icosandra.— J. C. S. Next week.— W. O. W. 1, Thuya dolabrat: variegata; 2, Weigela rosea var.; 3, Thuya gigantea (Lobbi of gardens); 4, Berberis Darwini; 5, Euonymus radicans variegata; 6, Cytisus racemosus.— C. W. Stapelia, next week.— Z. Z. We cannot name such scraps.— Mells. Cratægus Aronia; Pears, next week; Pinus pinaster cone.— Hants. 1, Croton volutus; 2, Craten corrections: 3. Pracema magniants gracilis; 4. Croton cornutus; 3, Dracæna marginata gracilis; 4, Oracion cornentas; 5, Dracena muginata gracius; 4, Dracena congesta; 5, Dracena rubra; 6, Dracena terminalis.—T. W. B. 1, Anthemis tinctoria: 2, Geranium sanguincum: 3, Nepeti violacea; 4, Lamium purpureum var. maculatum; 5, Lysimachia vulgaris.—A. J. Peziza aurantia.—E. H. C. Sisyrinchium Bermudiana; is it wild in your neighbourhood '-D. A. B. Panicum capillare of gardens, -C. S. R. B. Panicum capillare, -T. B. Oncidium prætextum, -A. S., Narwich. Maclura aurantiaca, the Osage Orange, -J. M. Phytolacca icosandra, - If J, J. Why address the publisher on such matters ' It causes delay and trouble. Thank you, however, for sending good specimens. 1, Caryopteris Mastachanthus ; 2, Osmanthus Aquifolium ; 4, Cryptomeria japonica var. elegans ; 3, Retinospora plumosa. J. H. Your specimen is insufficient.

OVAL SHAPED FLOWER BED: J. W. There is no "proper"-shaped form of an oval. The bed should be made of such dimensions that it be suited to the position it will occupy on the lawn or in the flower ı arterre.

Rhode Dendron: Ray, Yours is probably Rhode-dendron Gibsoni, It is not easy to propagate from an old worn out plant such as you describe, but you may succeed if you put the plant into a warm greenhouse now, and after a time take cuttings, which you should keep in the same house as the plant, and cover with a bell glass.

SCHEDULE AT FRUIT SHOW: J. F. The indges were wrong to disqualify the collection of varieties of fruit, because it is their duty to interpret the schedule literally, and if the wording be "varieties," should be permissible to exhibit two varieties of Apples or other fruit. The compilers of the schedule are the persons to blame in this case, as in most others. No doubt they worded the closs for varieties, and at the same time required distinct blades. See a few districts the same time required distinct blades. tinet kinds. See p. 5, Rules for Judging, and Suggestions to Scholule makers, published by the Royal Horticultural Society, price 1s 4d., post-free.

SEEDLING TYDAAS: J. P. Your Tydeas show great variation, and are very pretty, though not more so than many others previously in gardens. We cannot say whether your crossing of the varieties as you describe it has made a difference. The form of the tube ecrtainly seems more ventricose than we have before noticed.

Spanish Chestnuts: Streathorn, If you buy the best kinds of Chestnuts in the shops and layer them in a cold frame in sand or light soil, protecting them in hard weather by means of litter, for they must not get frozen, they will have germinated by the spring; and when the ground has got warmed a little you may plant them out where they are to grow permanently. Mark the position of each with a stake, to which the young plant may be loosely fastered when it reaches the height of I foot. Walnuts of all kinds may be treated similarly, for being deep tap rooted trees, they grow better and are less hable to be blown over if this root be retained, which is not always the case when once or twice transplanted.

Tomato Fruits: F, θ, G . There is no fungus disease in the Tomato fruits, and no means of deter mining from them alone what is the cause of It must concern the plants themselves, and their surroundings. M. C. C.

Tomato Roots: F. G. S. The roots are affected with eel-worms, often figured in these columns. Burn the plants, turn out the soil, and start with

AND SIXPENCE FOR EVERY ADDITIONAL LINE.

If set across two Columns, the lowest charge will be 20s. If set across three Columns the lowest charge will be 30s. Page, 28; Half Page, 24 10s.; Colume, 23.

Advertisements guaranteed to appear on the front page are charged at the rate of 1s. per line, head line counting as two lines. No display is allowed.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Position.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Adver-tisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they

wish repeated.

POSTAL ORDERS .- To Advertisers, Subscribers, and Others.—It is very important in remit-ting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. G. COVE, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements. 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

Friday Next, November 6, 1896.

SALE of SUPERB TYPES of CATTLEYAS and L.ELIAS, GRAND PLANTS, in GRAND ORDER.

CATTLEYA INTERMEDIA WHITE, probably the LARGE, LOVELY WHITE VARIETY PARTHENIA,

- CATLENA INTERMEDIA WHITE, probably the LARGE,

 LOVELY WHITE VARIETY PARTHENIA,

 Also 10 Plants of CATTLEYA INTERMEDIA SNOWFLAKE,

 We guarantee the plants to be according to our description; buyers can fully rely in each and every case on our guarantees. We shall show a preserved flower on the day of Sale which will give an idea of the great size of the White Blossoms of the incomparable Parthenia.

 L.ELIA PURPURATA.—Found growing with the white intermedias and a remarkable type of Ledia elegans. We warrant them special. Collected oo the miniland, and quite from a different district to where purpurata usually comes from. Many splendid specimens are among them. We never saw so great a variation displayed by a consignment; it is wonderful: and the plants could not be in better order. Many exhibition specimens are among them: they are a superblot of plants, with plump bulbs and fresh green leaves—full of native vigour.

 L.ELIA ELEGANS.—Most remarkable type, found growing with Ledia purpurata, white Cattleya intermedia, and a very distinct Cattleya Species or Hybrid. The type is wonderfully distinct and varied-looking. They are in grand order, and varieties among them are certain. There are snow-white flowered forms, and deep purple varieties with broad spreading flowers among them. Our man apaaks most highly of them, and also of the large white-flowered intermedias he speaks in glowing terms. The white and crimson elegans, and superb purpuratas, were all found growing together.

 CATTLEYA SPECIES(?). Hybrid between Ladia elegans and Cattleya Leonoldi. A few remarkable plants found
- all found growing together.

 CATLEYA SPECIES(?).—Hybrid between Ladia elegans and Cattleya Leopoldi. A few remarkable plants found growing with Ludia c'egans, L. purpurata, the white intermedia, and Cattleya Leopoldi. The natives say they have hig flowers, with bright crimson lip, and golden, crimson-spotted segment.

 ZYGOPETALUY GAUTIERII.—The bluest of blue Orchids,
- more ne rly approaching sapphire-blue in its intensity than any other Orchid. No collection should be without this really superb Orchid, which is invaluable for hybridising.
- CATTLEYA TRIAN.EI.—Not the red Popayan form, but mostly the round, fungoid, white-sepaled and petalled kind from Cundamaras,
- CYPRIPEDIUM CILIOLARE A beautiful Slipper Crebid, now very scarce, and difficult to obtain, valuable for hybridising and cut flower work.

Also ONCIDIUMS, BRASSAVOLAS, &c.

Also BEAUTIFUL ORCHIDS in FLOWER, &c.
TO BE SOLD BY AUCTION BY

TESSRS. PROTHEROE AND MORRIS, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, November 6, at half-past 12 o'clock, by order of Messrs, Sander & Co., St. Albans.
On view morning of Sale, and Catalogues had.

Friday Next.

MESSRS, PROTHEROE AND MORRIS will ESSEL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, Nov. 8, at half past 12 of clock, a larger importation of GATFLEYA MOSSLE, just received in spleaded condition, exss. "Don," many of them in very fine masses, some gigantic, probably the largest ever imported, one having 200 bulbs, another 190 bulbs, and one 115 bulbs, besides a large number with 2, 30, and 40 to 50 bulbs each, and upwards. They are from a new district, which accounts for the remarkable size of the specimens. Among them may be expected white and various other rare varieties.

Also a small but choice importation of L.E.SIA PR.ESTANS, received direct—another property.

On view morning of Sale, and Catalogues had.

To be Sold.

TO DE SOID.

THE NORMANDY MANOR NURSERIES, near Guildford, Surrey, area 42 Acres, with 16 Greenbouses, efficiently heated by 2700 feet piping, to be Sold, on advantageous terms, to wind up the Estate.

Gardeners' Chronicle.

SATURDAY, OCTOBER 31, 1896.

PICTORIAL ASPECT OF KEW.

THE fine series of views of the lake in the Kew Arboretum and its vicinity, the work of M. and Madame de l'Aubinière, were referred to in the Kew Bulletin for last year (p. 303), when a selection from them was placed on exhibition in the North Gallery. The talented artists have now had twenty-four of the most characteristic engraved by Count Ostrorog, and published in a volume entitled The Poetry of Kew Gardens, of which Her Majesty the Queen has been pleased to accept the first copy. At their request the Director turnished the following preface:-

"Visitors to Kew who admire its stately trees, its sylvan glades, and its spacious lawns, probably in most cases suppose that Nature endowed it with its charms. But this is far from being the case. Kew throughout is the ereation of the art of the gardener applied continuously for a century and a half, and never even at the present day ceasing to modify, develop, and refine.

Landscape gardening, as exemplified in such a domain as Kew, is peculiarly English. It originated, no doubt, partly in an intelligent appreciation of the possibilities afforded by the climate, which allows smooth turf to grow in a manner unknown in other countries, partly in the demand for giving to country mansions harmonious and sympathetic surroundings. Its evolution has been gradual, and it is not without interest to notice that Kew has been the scene of the earliest attempts of its successive masters.

English gardens down to the end of the sixteenth century were ordinarily walled enclosures laid out with extreme formality. They were adjuncts to the dwelling-house, and shared its defensive protection against disorder. The gardener stayed his hands at the limits of his boundary.

Though in the next century walls gave way to hedges, the treatment of the garden still remained formal. The stately methods of the great French landscape gardeners were bodily transported to England at the Restoration. They were, it may be admitted, well suited to splendid pageantry and a grandiose mode of life. But they were only adapted to large domains, as they sought to bring the surrounding park into connection with the garden by the plantation of extended avenues. This extension was the germ of landscape gardening proper; but the defect of the system was that its interest was almost exhausted at a first impression, and its monotony soon became wearisome.

The beginning of the eighteenth century saw a violent reaction against the formal style. This was largely due to the influence of Pope and Addison. Switzer was the first to introduce 'rural gardening.' The object was to connect the garden with its natural surroundings without the stiff and costly methods of Le Nôtre.

Bridgeman at about the same time went even further. In the Royal Garden at Richmond (now incorporated with Kew) he 'dared to introduce cultivated fields, and even morsels of a forest appearance.'

Kew, as it exists to-day, was formed by the fusion of two distinct properties or domains, both royal, but with entirely different histories. They corresponded roughly to the west and east halves of the present gardens. The western half was known as Richmond Gardens (or the Royal Garden at Richmond). The eastern half corresponds in great part to the grounds of Kew House, and to this the name of Kew Gardens was originally confined. The two properties were separated by Love Lane, the ancient bridle-road between Richmond and Brentford-ferry. This was shut up, and the two properties thrown together in 1802.

Frederick, Prince of Wales, the father of George III. obtained in 1730 a long lease of Kew House. Sir William Chambers, who erected the Pagoda, the Orangery (now Museum No. 111.), and other buildings, many of which have not survived, gives a description of the eastern half of the gardens in the middle of the last century.

'The gardens of Kew are not very large, nor is their situation by any means advantageous, as it is low and commands no prospects. Origininally the ground was one continued dead flat, the soil was in general barren, and without either wood or water. With so many disadvantages, it was not easy to produce anything tolerable in gardening; but princely munificence, guided by a director equally skilled in cultivating the earth and in the polite arts, overcame all difficulties. What was once a desert is now an Eden.'

The task could not have been easy. But there seems reason to believe that in the main features which still survive it was the work of Kent, who has been termed the 'founder of the school of landscape gardening.' By the introduction of the sunk fence or ha-ha (largely used at Kew) instead of walls or fences, he brought external scenery into his landscape effects.

An even more celebrated practitioner of the art, 'Capability Brown,' was employed by the Dowager Princess of Wales to remodel the western half of the gardens. A pretty clean sweep was made of the 'rural gardening' of Bridgeman. Brown's entire plan, which included the erection of a new palace, was never carried out. But Kew probably owes to him the beautiful Hollow Walk, now devoted to Rhododendrons, which, according to local tradition, was made about the middle of the last century by the Staffordshire militia while quartered at Kew.

For the greater part of a century after this Kew remained comparatively untouched. After the accession of Her Majestytto the throne it was determined to devote it to the purposes of a national botanic garden.

Sir William Hooker was appointed the first director, and assumed office on April 1, 1841. The part then opened to the public was only the original Botanic Gardens of about 15 acres. The remainder had lapsed into the condition of a wilderness, and was used as a game preserve by the late King of Hanover.

By slow degrees the ground accessible to the public was increased, and in 1850 the whole of the 'pleasure-grounds' were thrown open. Sir William Hooker

found himself in charge of a spacious area, in many parts thickly wooded and overgrown, but devoid mostly of distinctive features or pictoresque effects. The problem which he and his successors have had to face was how to treat this so as to convert it into a beautiful garden after the English plan, and yet utilise it for the scientific purposes to which it had been devoted.

The plan adopted was that which has been customary in the treatment of great domains in this country in more recent times. It combines something of the more ancient practice with a free employment of that which succeeded it. The formal treatment which is still needed to harmonise gardening with architectural effects blends insensibly with the naturalistic, which is most appropriate at a distance. Formality has neither been carried into the landscape with Le Nôtre, nor banished altogether with Kent and Brown. When large buildings-the Great Palm-house, the Winter Garden, the New Museum, and the Water Tower-were erected for the new purposes to which Kew had been devoted, the ground immediately adjacent to them was laid out under the advice of Nesfield in a strictly formal and stately way. To him are also due the long vistas which stretch away into the pleasure-grounds, now the Arboretum. The more distant portions have been gradually remodelled, the aim being to weave the various collections of trees and shrubs into a whole which should avoid an artificial, and yet yield an agreeable effect, while still subscrying a definite purpose. It can hardly be doubted that the result has been successful, and that it is possible to construct a great botanic garden which shall sacrifice nothing to its object, and yet be neither arid nor ugly.

The lake at the southern end of the Royal Gardens, like every other picturesque feature which they contain, is of entirely artificial origin. It is difficult, pethaps, now to realise that the ground it occupies was once as flat as the rest. The lake was commenced about forty years ago by Sir William Hooker, who had nothing more than an old gravel-pit to work upon. It was further developed by Sir Joseph Hooker, and no pains have since been spared to improve its scenic beauty.

Improve its scenic beauty.

I believe it was by accident that its pictorial merits attracted the attention of M. and Madame de l'Aubinière. At any rate, they have devoted two years to the work of depicting its varying aspects, and a collection of their studies is exhibited in a room at the North Gallery." Kew Bulletin.

NEW OR NOTEWORTHY PLANTS.

CATTLEYA HARRISONIANA, BATEMAN, COMTE VISART'S VARIETY.

This is a very good thing indeed. Imagine a well-developed flower of the typical form, but of the purest snowy white except a little pale golden yellow blotch on the lip, and some purplish microscopical spotlets on the reverse-side of the sepals. The flower I have at hand is in its natural position, full 10 cm. (4 inches) across, the odd sepal linear lanceolate, the lateral ones falcate, and elegantly bent downwards; the petals are broader, and waved at the border; the lip is rather different from that of Cattleya Loddigesii, the species to which C. Harrisoniana has close relation, but the middle lobe is more waved and crisped; the veins are stronger marked, and the five longitudinal keels are very elevated. If botanists regard those characters as trifling ones, this question may be discussed at another time, for to-day Cattleya Harrisoniana stands as a true species also accepted by Reichenbach, who changed the name to Epidendrum Harrisonianum. If the typical plant is estimated as desirable, this variety will be appreciated far more. Albinos are very much in fashion to-day, but true albinos of every species are always very scarce. Among a large lot of the typical specimens imported by Mr. F. Sander into his new ostablishment at Bruges, very few specimens of this variety were found. One of them was purchased by Count Visart, St. Croix,

Bruges, and flowered for the first time in the collection of this gentleman, who was highly surprised and enchanted to find himself that morning the beatus possidens of this fine plant. F. Kränzlin.

RABY CASTLE GARDENS.

RABY is, perhaps, one of the grandest places from a horticultural point of view that is to be found in England, and the baronial castle, surrounded by its meat, is one of the most characteristic structures any where to be seen, being in a perfect state of preservation. It is situated one mile and a hal, north of the village of Staindrop, and is traditionally supposed to occupy the site of the house given by Canute to the church of Durham. The present edifice is principally indebted for its splendour to John de Neville, who in 1379 obtained a license to construct a castle on his manor, and to embattle and crenulate its towers and walls. The park consists of some hundreds of acres, and is well stocked with various species of deer, and the breed of red deer is considered to be the finest in England; fallow deer are also numerous.

On the occasion of a recent visit, we entered the "East Garden" through the old gateway, which is in keeping with the castle. The chief features of this garden are fruit-walls, a ribbon-border and hedges of Fochsia Riccurtoni, which is hardy in the northern locality if protected by straw and mats. This variety of Fuchsia is used as a background plant in all the flower borders at Raby. On the north wall of this garden well-trained healthy young Morelle Cherry-trees were bearing heavy crops of fruit; the most of them were planted by Mr. Tullet, the present gardener. The Apples grown in this garden are principally culinary sorts, and the trees are young, in a good bearing condition, and at the time of my visit were laden with fruit of large size.

The south wall has in front a berder 12 feet wide, which is bedded out in ribbon style, with Henri Jacoby Pelargonium, Alyssum maritimum, Mrs. Lever pink-flowered Pelargonium, Viola Bullien, and a splendid Lobelia of Mr. Tullet's raising, its beautiful colour and compactness stamping ita s one of the best Lobelia erinus in cultivation. On the opposite side to the ribbon border we come face to tace with one of the finest sights in the way of a wire fence, covered with Clematis Jackmani. About every 7 or 8 yards standards are raised which create a grand effect, and interspersed are a few Lady Careline Neville Clematis.

The other walls are covered with fruit trees, and one half of a wall 200 yards in length, has been replanted with the hest known kinds of Pears; and on the other part of the wall the Plums, Pears, and Apples, are in good condition. One lean-to house, built against the south wall, measures 50 by 9 feet. It is planted with the well-known Raby Castle Fig. and the trees were bearing a good crop of fruit of fine quality. All round this garden a ribbon-border runs for 150 yards, in a semi-circle. At the background of this border is a hedge of Fuchsia Riccartoni, next a row of Calceolaria Golden Gem; Rev. Atkinson and Bonfire zonal Pelargoniums; also silver-leaved Pelargonium May Queen; Viola Blue Bell, theu Pyrethrum, and finally an edging of Lobelia erinus. On the south wall there are two late Peach-houses, 120 feet in length. All the fruit-tree borders have been remade by Mr. Tullet since he came here. Some of the old trees were replanted, and others shifted, and throughout the house the trees were noted as being heavily cropped with fruits of fine quality. The l'eaches chiefly consisted of the varieties Dr. Hogg, Sea Eagle, Bellegarde, Barrington, Royal George, Noblesse, and Princess of Wales. Nectarines are Piue-apple, Elruge, Lord Napier, and Pitmaston Orange. In front of these Peach-houses is a triangular bed, filled with hedding plants, the centro being filled with sub-tropical and fine-foliage plants, goldenleaved Elder being used with good effect.

Leaving the east garden by an archway covered with Clematis in full flower at the time of my visit, the visitor enters the Rose and Carnation garden. This is laid out in the Italian style, and the beds are

filled with Carnations and Roses; the varieties of the former mostly planted are Raby Castle and the old Queen of Bedders, a very fine scarlet variety. The scrolls all round were very effectively planted with red and white dwarf scarlet Nasturtiums, Viola Bluebell being used to bring out the colour. The Rose heds are filled with all the leading varieties, and the plants were clean and healthy.

Passing from this garden we enter the "grass-garden" by the fountain, which is one of the prettiest of the Raby gardens. It is entered from the eastle by a new gateway, which forms also the chief entrance to the gardens. The middle-walk has a border on each side planted with Hollyhocks as back-row plants. About 40 yards from the gateway

plants of Yueca aloifolia, and three of Campanula pyramidalis. All these clumps are loosely arranged on the grass.

At the top of this garden, which has a southern aspect, is a wall that is covered with Apricot trees, young, healthy, and which bore splendid crops of fruit. In front of the wall runs a border 12 feet wide, most effectively planted in ribbon style.

Passing from this garden, the "Dutch garden" is entered. It is well sheltered by Yew hedges of good height. The beds were filled with plants having a choice blending of colours. Several beds of tuberous Begonias in this garden were very fine, the plants blooming profusely. At the top of it, facing south, is a conservatory 100 feet in length by 20 feet in

Mr. Tullet told me that the Vines carry fine bunches of fruit. The principal feature in this garden consists in its borders of herbaceous plants, which contain most of the leading kinds of herbaceous perennial plants, the borders being a porfect mass of bloom during spring, summer, and antumn. The plants are arranged in rows, and the back row consisted, this year, of Cactus Dahhas, double flowered Poppies, then came Zinnias in mixture, then rows of Asters, and of East Lothian Stocks. Another border was planted with Tritoma Uvaria as a back line plant; following this were, in order of their names, Anemone japenica, zonal Pelargoniums, and Viola Bullion.

We now enter the chief plant-houses. One span-

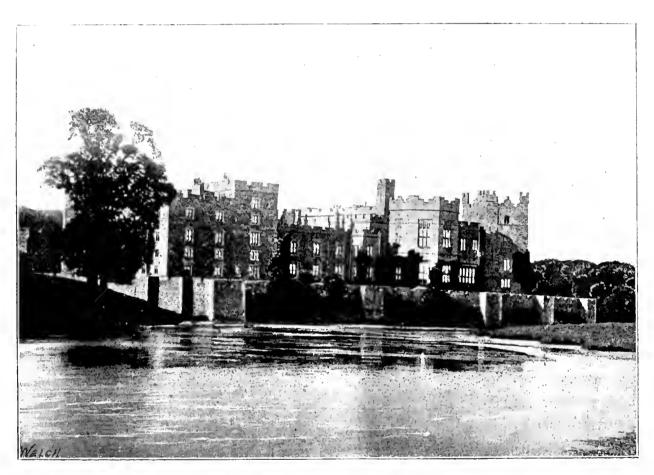

Fig. 92.—RABY CASTLE, DURHAM. (SEE P. 520.)

the visitor comes to a small lake, furnished with a fountain in the centre, surrounded by a rockery, the stones of which are covered with natural moss. This garden is also bounded by fine old Yew hedges, and it has a lawn in the centre, upon which is a very fine bed, planted this year, in a simple manner, which was a glorious mass of flowering-plants. Dracæna Veitchii serves as a useful centrepiece, with Scabious, silver-leaved Pelargonium May Queen, small Fuchsias, and Perilla Nankinensis, filled the bed which was bordered with Blue Bell Viola. A feature in this garden consists in sub-tropical plants dotted about in clumps of three or six; one clump noticed was formed of three Bamboos, which grow from 6 to 8 feet in height, and of three Campanula pyramidalis, 4 to 5 feet high. Other clumps were formed of three plants of Phormium tenax Veitchii and three Lilium auratums; still another clump was planted with three width—a half-span. The roof of this building is covered with creeping flowering plants. One feature of the place is a large plant of Brugmansia alba, prescuting a noble appearance when covered with its large white flowers. Orange-trees in this house were bearing fine fruit of good quality; and the honse, on the whole, is well filled with choice plants, showing, in their clean and healthy appearance and profusion of bloom, good cultivation.

Leaving the Dutch gardeu, we go westward to the gardeuer's house. On the south wall of the garden at this point are two Peach-houses, one an early house, the other a succession-house. The trees in these peacheries are healthy, and bear excellent fruit, especially noticeable being the varieties of Peaches, Sea Eagle, Exquisite, Goshawk, and Stanwick Elrugo Nectarine. A vinery forming part of this range is the earliest house, but the Grapes were all consumed.

roofed house is 150 feet long by 24 feet wide, divided into three parts. Entering by the western door, the stove division is entered; here the plants include the best known species in cultivation, including many of recent introduction. Every plant is in good condition.

A second house, devoted to the cultivation of stove plants, was entered from the first one, and in this was found a huge specimen of Cycas revoluta in fruit, and other fine specimens, notably Maranta Voitchii. Phomix rupicola, and a magnificent specimen of the Golden Fern. Some Bananas in this house are well done. A few Orchids noted here are also well grown.

Passing from the stoves, a greenhouse was entered, in which a Lapageria rosea extending over the roof was a grand feature, it being covered with blooms at the time.

These three houses are well adapted for plant-growing; all the brick-work used consists of glazed white brick, which has a clean bright appearance. Ranges of pits skirt the front of these houses; cold ones are devoted to Violet-growing, for winter supply, the variety Marie Louise being one of the varieties grown in quantity; Lady Hume Campbell is also thought much of as a Violet for succeeding M. Louise.

After the Violet pits come those in which Cucumbers are grown; then Pine-pits on the old system—the Pines grown in them are very fine. The varieties consist of Queen, smooth Cayenne, and Charlotte Rothschild. The fruiting Pine-stove is an old-fashioned structure that serves its purpose very well; it is divided into two compartments.

The propagating ground is large, as it needs must be to supply the requirements of the place. Passing from the plant-houses the North garden is reached, and note is made of the fine specimen Conifers. A wall facing south extends the entire length of this garden, on which are built the four chief vineries, which have a length of 200 feet by 20 feet in width. All the borders in these houses have practically been renewed recently, and the Vines show the good effects of this, the canes being strong, and the foliage clean and healthy. The Vines bear fine crops of Grapes, large in bunch and berry, that colour well. The varieties mostly grown are Barbarossa, Madresfield Court, Gros Colmar, Muscat Hamburgh, Black Hamburgh, Black Alicante.

The Muscat Vines look well, and several new canes have been planted. The last house consists principally of Hamburghs, the crop was a nice one, and the fruit well-coloured. To the north of this garden we come to what is called the "new kitchen garden." of 4 acres, made two years ago. This garden is intended principally for the growing of winter vegetables, all of which had a most healthy vigorous appearance. The advantage afforded by this new garden is that owing to its exposed position, the crops grown in it are thereby better enabled to resist the rigours of a severe winter than those grown in sheltered gardens. John McIntyre, Woodside, Darlington.

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM & LEYSENIANUM.

This is one of the most distinct of recent seedlings, taking front rank among the bellatulum crosses, and a plant of it is flowering in the choice collection of Samuel Gratrix, Esq. (Mr. David McLeod, gr.), West Point, Whalley Range, Manchester. The flower is after the general outline of the Fairrieanum breed, having arching petals, in this particular instance elongating to a point considerably under the level of the thimble shaped pouch. The dorsal sepalis roundly ovate, in colour a fine purplish-rose, flushed with deeper rose lines, radiating from base to extremity. At the basal portion is a cloud of green; the inferior sepal is half the size of the dorsal, with fine rosy-pink lines on a greenish-ground, purely ovate. Petals much broader than any of the Fairrieanum breed, but twisted, or rather screwed, of beautiful arching outline, groundcolour greenish-white, with a profusion of very distinet chestnut spots, with a general flushing all over the surface, as in the dorsal sepal. The pouch is formed as in bellatulum, it is very smooth, and of a vinous colour; staminode reniform, and exposed, with a cloud of dense lines around it; peduncle twice the length of that of bellatulum. Mr. Gratrix bought it as a cross between bellatulum and barbatum; but this is evidently a mistake—there is no barbatum about it. It is more like vexillarium × bellatulum, as the flower could not have an arching outline in its petaliferous limbs with either barbatum or bellatulum commingled. There is no doubt about it being from bellatulum, and from a second remove of the Fairrieanum breed, possibly vexillarium. J. A.

ORCHIDS AT BULSIZE GROVE, HAMPSTEAD.

The suburbs of London contain many pretty and interesting gardens, and Orchids are cultivated in a

greater number of them than is generally supposed; and, singularly enough, where properly cared for, they thrive better than most other plants, and in spite of London fog and smoke, they give a better proportion of autumn and winter flowers than other warm-house plants generally do. A very good example is found in the garden of W. Shuter, Esq., at Belsize Park, where Mr. Armstrong, the gardener, succeeds in cultivating Phalenopsis successfully, a feat which many in more pretentious country gardens cannot boast of. The plants have been kept in health and flowered regularly for years. They never grow into large specimens, for as a leaf or two is made others are lost; still, they preserve their good health. Another satisfactory Orchid in Mr. Shuter's garden is Pleione lagenaria, of which there are at the present time some very pretty plants in 48-size pots, covered with pretty white and crimson flowers.

In the warm - house the Calanthes have made splendid pseudo-bulbs, and are sending up stout spikes; and many species of Cypripedium are in bloom, including C. Spicerianum, C. Sedeni, and C. longifolium; also Aërides virens, Coelogyne speciosa, Epidendrum osmanthum (known in gardens as E. Godseffianum and E. Capartianum), and several other species. Through his large correspondence with the tropics, Mr. Shuter often gets some singular species and rare plants, and many years ago, when Cattleya eldorado and its white variety C. e. Wallisii were little known in gardens, we remember sceing quite a show of their pretty, fragrant, and variouslytinted flowers in his Orchid-house. Nor are other branches of gardening neglected, as witness the fine house of Chrysanthemums which Mr. Armstrong has set up; the heavy crop of black Alicante Grapes; the good supply of Cueumbers, and the great variety of pretty table and decorative plants, such as Crotons, Dracanas, Amasonia punicea, Saintpaulia ionantha, Streptocarpus, &c., to be seen in beauty in the houses. Cardening in London may be difficult, but diligence always secures good results.

L.ELIA PUMILA.

The plant known in gardens as Ladia prestans has been flowering in collections for some time past, and although they exhibit great variety, there is no doubt that they may be referred to the typical Ladia pumila. On the other hand, the species often called Ladia pumila Dayana is a distinct species, which should be called Ladia Dayana.

The finest form of Lælia pumila which we have seen this season is forwarded from the collection of Dr. Jessop, Roundhay Mount, Læds (gr., Mr. T. Tyson). In colour it is rich and bright, and its broadly ovate petals exceed 5 inches across, measured together, the width of each being 2 inches. It is a very pretty species, and the flowers in proportion to the stature of the plant, are of extraordinary size.

Sketch and photographs of a fine variety of the same species are kindly sent by Ernest A. Tucker, Esq., Vernon Lodge, Preston, Brighton. J. O'B.

THE TERCENTENARY OF THE POTATO.

It is with great pleasure that we notice that an exhibition to commemorate the tercentenary of the introduction of the Potato into the United Kingdom is to be held this year at the Rotunda Rooms, Dublin, from December 8 to 10, under the auspices of the Irish Gardeners' Association. We wonder what would have been the result had not the tuber found a home on our shores, for without pausing to think of what would have taken the place of the Potato in the food of the working-classes of England, it would have meant starvation entirely in many districts of Ireland, where the Potato is the staple if not the only food, and its cultivation the one industry of the inhabitants. If the pig pays the rent in the sister islo, the l'otato certainly feeds its master, and in many parts of the western coast a dish of Potatos, with an occasional fish, constitutes the whole of the menu the full year round.

The vegetable, which belongs to the natural order

of the Solanaceæ, is believed to have been well known to the natives of Chili and Peru, from whom it is thought by many authorities to have been procured, and brought to England from Santa Fé by Sir John Hawkins in 1565, while others maintain that it was introduced into this country by Sir Walter Raleigh, in 1586; others, again, ascribing its introduction to Sir Francis Drake in the same year. Certain it is that Queen Elizabeth two years previous, viz., iu 1584, granted a patent "For discovering and planting new countries not possessed by Christians," when Sir Walter Raleigh equipped some ships and set sail for America. Thomas Herriott, who accompanied this expedition, sent home the description of a plant called Openawk by the natives of Virginia. Gerard, in his Herbal, mentions that he had the plant from Virginia, that he had grown seedlings of it in 1590. and that it grew admirably in his garden. He gave it the name of Solanum tuberosum, afterwards adopted by Linnæus, which title it still retains. The plant is stated to have been generally introduced in 1592, and its first culture in Ireland is generally credited to Sir Walter Raleigh, who had large estates in that country round and about Youghal, in the county of Cork, in 1596 (according to some 1595), and it is this date which is to be honoured by the tercentenary exhibition; the house and garden where it was grown still exists, and are shown.

Sir Robert Southwood, President of the Royal Society, claimed the honour for his grandfather of having first cultivated the plant in Ireland, he stating that his ancestor obtained roots of the plant from Sir Walter Raleigh's gardener at Youghal, on going to taste the Apples of the fine American fruit, being so sadly mertified at not finding them, and of his subsequent discovery of the tubers, when his master desired him to throw out the weeds, is probably authentic. The Potato, it seems, had been known in Europe for some considerable time before, though the tuber was not known in Flanders till 1620.

A fine kind of l'otato was first brought from America by Mr. Howard, who cultivated it at Cardington, near Bedford, in 1765, and its culture in England became very general soon after. The name which we now apply to it seems to have been taken from the Spanish and Portuguese, while they derived the epithet from the mountaineers of Quito in South America. The inhabitants of Quito called it Papas, which the Spanish corrupted into Battata, and the Portuguese softened it into Batata, hence the English Potato. The plant was cultivated in Ireland long before its introduction into Lancashire, which was owing, it is said, to a shipwreek at the mouth of the Ribble. From Lancashire it soon spread, first to the gardens, and gradually into the fields of Great Britain.

The failure of the Potato crop in Ireland for several years, especially in 1846, caused a famine, to which succeeded a pestilent disease of which multitudes died, among them many priests and physicians. Parliament then voted £10,000,000 sterling for the relief of the inhabitants, and several countries of Europe and the United States of America forwarded provisions and succour of various kinds. In 1868 half a million acres were under l'otato cultivation in England and Wales, against one million acres in Ireland alone. In 1872 the l'otato disease prevailed very extensively in England, and in consequence the value of Potatos imported amounted to £1,651,240. against £225,732 only the preceding year. In 1876 a great deal of alarm was caused by the importation in the autumn of the American Potato-beetle, a bug which came to he very generally known as the Colorado-beetle, but which has now very fortunately been well nigh exterminated, at any rate on this side of the big ditch.

Although we import now a very large quantity of Potatos, not only from abroad, but from the Channel Islands, these latter being generally the first in tho market, there is no doubt that the British-grown tuber still holds its own, and this is shown in the fact that during the past twenty-five years the trade has undergone a great and a significant change for the better, the volume of imported Potatos

having very considerably decreased. For the three years ending 1875, the annual average importation was 268,157 tons, while for the three years ending 1895 the annual average importation was only 154,835 tons, an average decrease of no less than 113,322 tens. This year, although the crop has been large, it is now, owing to the rains, becoming very diseased, and those Potates which are still in the ground may be looked upon as doomed. Indifferent sorts are now fetching only £1 per ton, and many growers in the Fen districts are offering good sorts at as low as 10s, a ton, and the common varieties they are giving away to whoever likes to clear them. When it is borne in mind that in the poorer districts of London anything but good Potatos are retailed at a halfpenny a pound, which means at the rate of £4 5s. per ton, some idea of the profits made by costermongers and greengrocers will be gained, while the better sorts are sold at prices which yield from £6 to £7 per ten. The German redskins, which were formerly very popular, have declined very much in favour, while the Belgian kidney is also now very seldom seen in the markets. From its importance alone as a staple food, the Potato deserves to be honoured by an exhibition, the more so as its cultivation is essentially an industry of the British Isles.
Well may we say, "Florest Potato, root and branch!" H'm. Norman Brown.

COLONIAL NOTES.

WEST AUSTRALIAN PLANTS.

The Western Australian Year-book, a copy of which has just reached us, contains an article from the pen of the late Baron von Mueller on the "Vegetation of Western Australia," one corner of which we used to know as Swan River, but which now stretches from south to north, forming the eastern third of the great Continent. The Baron contributes a list of the extra tropical species of plants, among which are many of the greatest value for horticultural and economic purposca. The last sentence of the memoir has all the more interest in that it reached us after the death of the lamented botanist:-" In parting sorrowfully and reluctantly from this charming flora, with the elaboration of which the writer throughout more than forty years has become prominently identified, and which to his extreme regret he can hardly hope ever to see again, he trusts that, should life still be spared to him by merciful Providence, if he can still further unroll in future editions of this annual the descriptive picture of the great and largely unique We-tern Flora for fuller cognisance and appreciation, it will be to him one of the most pleasing of tasks."

TRINIDAD.

The October number of the Bulletin of Miscellaneous Information, published by the anthorities of the Royal Botanic Garden, contains a variety of notes of interest to the colonists, and to naturalists generally. Two drift fruits are mentioned, one the fruit of Manicaria saccifera; the other, which was not recognised till recently, is now shown to be the fruit of Sacoglottis amazonica, a tree belonging to the Humiriaceae, now discovered to inhabit the Cedros district of Trinidad, but previously only known from the banks of the Amazon. A note on the Sugar-cane shows that numerous seedling plants may now be seen in the gardens. Some of these may be found superior to the varieties from which they sprang.

CAPE OF GOOD HOPF.

Messrs, P. Macowan and Eustace Pillaus have prepared for the Department of Agriculture an excellent treatise, entitled A Manual of Practical Orchard Work at the Cape. The Cape, speaking generally, has two very different climatic areas, the conditions in the eastern half being very different from those in the western portion. Consequently, special directions, applicable to each case cannot be given. The general principles of cultivation are nevertheless of universal application, and having grasped them, the cultivator should be in a position to apply them to his own

needs. The points most neglected in fruit culture at the Cape—may we not say the same here—are the incredible neglect of the mechanical condition of the soil, and the general avoidance of deep trenching, the unintelligent use of irrigation, the absence of any intelligent system of sub-drainage, unscientific pruning, both formative and in maintenance, and an easy satisfaction with seedlings that have thrown back, instead of only growing pedigree sorts propagated by bud and graft. Reform of cultural custom and practice on these five points lies at the foundation of all improvements in Cape fruit growing. The

FIG. 93 —FLOWER OF ABAUTHA SERICIFERAL SHOWING, MODE OF CAPTURE OF MOTH.

A, pollen-masses; B, their stalks; C, proboscis of moth; D, he d of moth; E, portion of antenna.

directions are given in so "racy" a style as to make them amusing reading, while their forcefulness should result in general improvement.

ARAUJIA SERICIFERA AND MOTH.

Some time ago a discussion arose in these columns respecting this plant, which is sometimes called the "Cruel Plant," the flowers of which were said to be capable of ensuaring moths and other insects, and it was also affirmed by some, and denied by others, that such was the case. I resolved to study closely the subject as soon as occasion offered, and I have just recently had ample material for so doing. That such is the case is undeniable, and I have made a rough sketch to illustrate the manner in which it takes place.

The family Asclepiadaceae, to which the Araujia or

Physianthus belongs, are very complicated in the structure of their flowers, and to illustrate the subject fully would require several diagrams of the different organs, but the accompanying illustration (fig. 93) is sufficient to show how it takes place. A shows the two pollenmasses, which are attached by B, two glaudular bodies in the form of a caudicle, or tail, to the stigma; and c represents the probossis of the moth entrapped.

The pollen masses, being glutinous, adhere to the proboscis, and by their peculiar arrangement and connection to the caudicles, B, a strong leverage or resistance is produced by the exertion of the moth in attempting to withdraw its proboscis.

Again, the probose's, which is thrust beyond the pollen masses, is caught a slight distance from the point, and the moth finding itself caught, rolls the end which becomes wedged tightly against the appendages which forms the corona.

One morning I found seven moths entrapped, including two large Privet Hawk moths (Sphinx Ligustri), and five Pot-herb-moths (Hadena olcracea), and other insects.

I am also further convinced that there is a change which takes place in the organs of the flower during the day-time, as I have observed that as soon as the sun shines upon the flowers, some of the noths succeed in effecting their escape; and I have also remarked that the Humming-bird-moth (Macroglossa stellatarum), which flies in the day-time, thrusts its probosels into the flowers without ever being crught.

It is probable that the warmth of the sun causes an expansion of the flower, or else there is but a slight sensitiveness in the organs. It is also curious to notice the little lixeds making their round in the morning amongst the flowers, searching for the moths which are entrapped. Riviera.

WHLOWS AND BASKET-WORK.

"Ir basket-work," says the Kew Bulletin, quoting from a paper by Mr. W. J. Cochrane in the Transactions of the Highland and Agricultural Society of Scotland, "is the main uso to which they are to be put, perhaps the best kind is the common white Willow, Salix alba, which grows fast and attains a large size, yielding tannin and salicin, while, in addition to its utility for basket making, its wood is suitable for wattles, fuel, and chip. The common Willow, Salix viminalis, is a very good osier for general purposes, being suited alike to rough and to delicate work; while a taller variety, the long-leaved Willow, Salix triandra, growing to a height of 20 feet, is one of the most useful of all Willows. Amongst others I would mention S. rubra and S. laurina; whilst if the substance salicin, obtained from the bark and used for medicinal purposes, is wanted, the species S. fragilis, or the crackling Willow, is recommended as being the richest in this substance, and at the same time yielding a fair amount of very good timber."

In order to determine botanically the different osiers bearing these local names, cuttings of a dozen kinds were obtained at Kew from Mr. R. Brown, Somersham, Hunts, a practical osier grower; these have now flowered, and have been definitely determined.

8, decipiens is very nearly allied to 8, frugilis, and is placed as a mere form under that species by many authorities; others regard it as a hybrid.

According to Mr. Brown, Nos. 1, 2, 3, 4, 6, 7, 11, 12, are the best for basket-making for the best class of work, while Nos. 5, 8, 9, and 10, are for rougher work, such as gardening-baskets (for Potatos fruit, see).

NOTES FROM THE MANCHESTER ROYAL BOTANIC.

CATTLEYA > PORPHYROPHLEBIA = INTERMEDIA > SUPERBA.-This is a hybrid, partaking more of the characteristics of the seed than of the pollen parent. In habit it shows some likeness to the growth of C. superba, with its stiff roundish leaves, and its plump smooth-skinned foot-stalks; but it is more after the intermedia type, both in foliage and in flower. There are three flowers springing from the sheath, larger than those of intermedia; sepals lanceolate; petals ovate, with a fine sheen of blush; lip very showy and of good size. The convolute half of it of similar colour to the segments, the lower portion expanding to more than normal form of either of the parents; theextremity being a clear shade of magenta, with the central lines running up to the end of columu, showing all the more prominently because of the white ground colonr on either side of these magenta There is no doubt that the intermedia colour and formation is a little disturbed, but not to the extent of either the bright colour and rather straggling form of a normal flower of Cattleya superba.

ACALYPHA MUSAICA.

This plant is easting a fine dash of colour in the Botanie stove. It is allowed to ramble amongst a mixture of stove plants, the roots getting through the pot into the bed of earth, and the wealth and beauty of the leaves arrest attention. The leaf is ovate acuminate, with numerous blunt serratures, and the intermediary ribs springing from the central one very prominent. What enhances its appearance is the effective crimson shade of the leafy matter between the subsidiary ribs. This, too, is interspersed with brownish-black spots here, and patches there, making an effective combination. As an ornamental plant it is exceedingly striking, not only for a botanic, but for any garden where there is a warm conservatory.

NEPENTHES - MASTERSII.

There is a grand plant of Nepenthes Mastersii growing in a square basket; suspended from the roof of the stove, there were scores of its fine ruddy brownshaded pitcher appendages, the pitchers being nearly all uniform in size, because of its being kept "short by the head," not allowed to ramble away, as when that is permitted the pitchers invariably elongate until almost to become converted into tendrils. There is no doubt that to suspend Pitcher plants within a short distance from the glass in a house where there is abundance of foliage within, and below the eye-line, encourages robust habit, and it is well exemplified here.

SEAFORTHIA ELEGANS.

There is a very fine plant of Seaforthia elegans in fine fruit in the Palm-house of the gardens. It is a splendid subject for ornamentation, either in a small or a large plant, and when one sees it with its ornamental drooping thyrses of inflorescence, it is more than pleasing. The crowds of red coffee-looking berries as round as a Rowan, get scattered about, and numerous self-sown berries are producing young plants about and around the parent tree. Unfortunately, to provide head-room for this giant among Palms, the house will shortly require to be raised; pity many of our Seaforthias have to be sacrificed for want of suitable accommodation.

PSIDIUM POMIFERUM.

This favourite species of the race of Myrtacce from the West Indies is in splendid fruit in an intermediate house. It is allowed to grow up and ramble away, its leaves rubbing the glass, and it seems to be easy of culture. It bears brownish stems with ovate leaves on short footstalks; the leaf is of a light shade of green. From the axils of the leaves spring the fruit, generally in pairs. The fruit ripens off into a fine shade of lemon, is round, and smooth in the skin. It is of excellent flavour. It is the first time I have partaken of the fruit of Psidium pomiferum, and I can thoroughly recommend it as an acquisition to the choicest dessert.

All these plants have been under the management

of Mr. Charles Paul since Mr. Bruce Findlay's decease, and these and the collection generally are doing well.

THE ANNEXE SHOW HOUSE.

This show house of 250 feet in length by 54 feet in width, is laid out with the view of forming a pleasing groundwork for exhibition plants. The promenades are spacious, 33 feet wide, winding round central beds, and offering a good view of all the subjects arranged on the sloping sides and in the central designs. The roof is curvilinear, tied together with suitable iron rods, and the living drapery is entirely of the five-lobed Ampelopsis quinquefolia. In summer, while the great midsummer show is on, it is simply beautiful, the festoons hanging down in all directions, hugging the taller Tree Ferns and Palms in the central beds; when shows are not on, it is kept filled with a variety of plants in flower, the main stay being Kentia Fosteriana, Seaforthia elegans, Latania borbonica, Areca lutescens, Chamierops excelsa, C. Fortunei, C. humilis, Dicksonia antarctica, Alsophila excelsa, R. Williamsii, Cyathea dealbata, Araucaria excelsa, and A. Cunninghami. At the time of one of my visits, Lilies were in flower, and the sides were covered with the useful Francoa appendiculata, the Tobacco plant, various Ferns, and Fuchias in groups, a collection of the handsome cut-leaved Japanese Maples, and several of the beautiful vari-coloured Cannas. From the luncheon entrance, which was the main entrance during the great exhibition of 1887, the view commands the whole area, from the steps down to the music room entrance, and on a great exhibition day it is one of the most pleasing of sights. J. A.

TREES AND SHRUBS.

ABIES BRACHYPHYLLA.

This is well worthy of attention, being of free growth, highly ornamental, and perfectly hardy. It is handsome in growth, having regular whorls of somewhat rigid, horizontally-placed branches, with densely-arranged small leaves, that are deep green above, and intensely silvery beneath. The cones are cylindrical, $3\frac{1}{2}$ inches long by $1\frac{1}{4}$ inch wide, and smooth by reason of the non-protruding scale bracts. The stem grows stont and straight, and when planted in light, dampish soil, and a sheltered site, the neward rate of growth is from 18 inches to 24 inches per year.

One of the largest and best-furnished specimens 1 have seen is growing at Claremont in Surrey, having been planted by H.R.H. Princess Beatrice on April 7, 1873; it is now considerably over 25 feet in height, the branches covering a spread of fully 18 feet in diameter.

There cannot be a doubt that in the present species we have a highly ornamental tree, and one that, if I am not greatly mistaken, will yet turn out of value for forest planting in this country. So much do I think of the tree, that I have just recommended its use in the formation of an avenue in an old-fashioned English park. A. D. Webster.

LAURELS.

Among broad-leaved Evergreens grown for ornament in Britain, the Laurels occupy a leading position. The best known are the "Common Laurel Cherry, Prunus Lauro-cerasus, introduced from the Caucasian regions about 320 years ago (1576); and the "Portugal Laurel," brought from Portugal about the year 1648. The Common Laurel Cherry is one of the most effective of evergreen shrubs in gardens and pleasure grounds, and when allowed to grow free, without cutting or trimming, it assumes the dimensions of a small tree, but rarely a shapely one, and in favoured localities it then bears, in good seasons, abundant crops of its cherry-like fruit. The typical variety of the Common Laurel is rather tender on wet and heavy soils, and is frequently killed to the ground in severe winters; but the two fine varieties, colchica, and rotundifolia, have both proved to be much hardier than the type, and are very distinct and effective in their appearance. Several other varieties of the Common Laurel are in cultivation, and all of them are more or less useful for ornamental planting.

The Portugal Laurel is a much hardier, and on the whole, a more useful shrub, since it is rarely killed by the severity of our winters, unless when planted in the worst situations; and it is more amenable to pruning and trimming without spoiling its appearance. And because of these valuable properties, it is much used in topiary work, and where it is necessary to keep the shrubs close cut in annually. There is not a better or neater covering for steep, formal slopes or terraces in pleasure-grounds than thickly-planted Portugal Laurels, cut back early in spring to a flat surface, from 1 to 2 feet above the ground. With a little attention to the removal of stem-shoots, the Portugal Laurel forms a haudsome small tree, and in good soil rises to a height of 40 feet or more. In this attractive form it might be oftener seen, if those in charge of vigorous young plants, growing in suitable places, would give them the needful attention, by training them to clean stems with wellbalanced heads for a few years. The specimens with clean stems and rounded heads, trained in imitation of Orange trees, and set out in many flower gardens, are minor examples of the appearance which wellmanaged standard Portugal Laurels would present, with the addition of a more natural and vigorous aspect.

Having occasion to inquire recently as to the existence of large and old specimens of Laurels in Britain, none were clearly traced to be over a century old, except where the specimens have been renewed by suckers, or side shoots, rising from the base of the original plants. What was said by Loudon, in his Arboretum et Fruticetum Britannicum, 1844, vol. ii., p. 719, to be "the largest common Laurel in the world," grew at Shelton Abbey, co. Wicklow, Ireland, aud was stated to be growing in a light loamy soil, on a sub-stratum of shingle. It was then ninoty years planted, 45 feet high diameter of trunk 6 feet, and of head 101 feet, The trunk is stated to have been about 13 feet high, and had an extraordinary diameter at that, as commented on by Loudon at the time. Like most of the old Laurels mentioned by Loudon, as notable specimens half a century ago, the Shelton Abbey Laurel has disappeared before the storm, forty or more years ago. It would be interesting if some of the contributors to the Gardeners' Chronicle would point out where old and remarkable specimens of Lanrels are to be seen, especially those the age of which is known to be approaching, or over, a century, with a note of their condition and dimensions at the present time. M.

GARDEN - TRAINING IN GERMANY.

[The following extracts are taken from an article in the *Dunder Advertiser*. We commend them to the notice of our readers in confirmation of our often-expressed opinion as to the absolute necessity for further and more thorough educational training in this country. Ed. l.

GEISENHEIM. - There are many schools for the study of fruit-culture in Germany, but this is the most important. It was established twenty-four years ago. The grounds extend to 74 acres, most of which are planted with Vines, though the fruit, flower, and vegetable gurdens are extensive. The buildings are large, and well furnished. In the laboratory I saw a lecturer working like a slave, with his sleeves rolled up, surrounded by those innumerable bottles and pipes and globes which are indispensable to the chemist. I was more at home in the botanical-room, with its wax models of fruit of every kind and colour, and its specimens of plants dying and dead, victims of those same germs-same, at least, to the ordinary individual, which bring decay and death to countless numbers of the human race. But perhaps I was most at home in the little jam manufactory, with its tiny pans and fruit-drying and peeling-machines. It is in every respect a model of neatness and perfection; while the wine manufactory seems to have every appliance necessary to teach the student how to transform the Inscious Grape into Rhenish wine.

The importance of this and similar institutions throughout the country, more or less closely con-

Students come to this college not only from the remotest part of the German Empire, but from all the ends of the earth. At the present time there are three students from Australia, one from France, and four from Russia. Before entering the college they must have a University education. The necessity for

Fig. 94.—AGAVE FEROX, IN FLOWER IN THE GARDENS OF THE MARCHEST HANBURY,

nected with the State, cannot be over-estimated, and they show conclusively the interest that is being taken in the development of the fruit trade; and the thoroughness with which the work is carried on goes a good way to explain, when applied to other industries, why the Germans are shooting ahead and taking the place of Britain in the markets of the world. this will be at once seen when I tell you that the subjects include chemistry, botany, anatomy, physiology, mineralogy, zoology, and mathematics; besides such subjects as the cultivation of fruit, flowers, and vegetables, the preservation and packing of fruit, and the manufacture of jam, jelly, and wine, land surveying, soil cultivation, landscape gardening, and I know not what besides.

A full course of study takes two years, and the probable cost is about £30 per year, which is triffing when compared with the expense of a University training in Scotland. It is not necessary to take all the subjects, and selection is made according to the aim of the student, and the period of training is in consequence reduced. For instance, just now there are twenty-three students entered for one year only. Besides there are seventeen studying fruit and Vine cultivation, and twelve studying fruit culture. Some of these students settle down on the Rhine, and others go to Italy or California and begin the practical work of life.

The school is run on popular lines, and short courses of lectures are given on such subjects as cultivating, packing, and drying fruit, the manufacture of jam and wine, and any other subject that may be of interest to those who cannot undergo a full course of training. These short periods of trition are invaluable to the gardeners and fruit-growers of Germany, and they seem to be taken advantage of. When leaving the college I saw about twenty or thirty men, some of them pretty well up in years, who had come to undergo a short period of training.

The Germans go to the foundation of things, and it will not be disputed that their ideas of fruit culture are far ahead of our own. But they are as practical as they are theoretical. At this college theory and practice go hand in hand. The working day begins at 6.30. Lectures are given then and during the forenoon. After dinner the students rough it out in the gardens and fields pretty much as labourers do, thus receiving an education which is indispensable, and which cannot be bought or obtained in any other way. The evening is devoted to transcribing notes; and those of the students who stay within the college grounds must retire at ten. Sunday is the only day they have to themselves, as on that day there is no work done.

AGAVE FEROX AT LA MORTOLA.

OUR illustration (fig. 94) represents a plant of Agave ferox, growing in the gardens of the Marchese Hanbury at La Mortola, near Mentone. The central plant in the foreground is Yueea aloifolia, at the left are plants of Agave Franzosini and Yucea guatemalensis; in the background is a flowering plant of Agave Salmiana, and near the enormous peduncle of the Agave ferox is a flower-spike of Agave filifera. The Agavo ferox was laden with seed-capsules, 2 inches long, in the tirst week of last August, and it would appear that this species propagates itself by seeds only, as it does not show any stolons around the base of the rosette of leaves or bulbils within the inflorescence, as so many other species do. The photograph from which our illustration was prepared, and the information concerning the plants composing the group, were kindly afforded by Mr. K. Dinter, the Curator of the gardens at La Mortola.

BELGIUM.

MEETING OF THE BRUSSELS ORCHIDÉENNE.

AT the meeting on Oct. 18, MM. LUCIEN LINDEN ET Cit. showed a group of fifty Lælia præstans flowering abundantly, the flowers distinguished not only by great variety of colouring, but by their exceptional size. These fine specimens were newly introduced. The same firm showed also an extra dark Oneidium Lanceanum, a very pretty Odontoglossum Hnnnewellianum, remarkably coloured; quite a collection of Cattleya labiata, Lælio - Cattleya illuminata (C. labiata autumnalis > L. purpurata), with the sepals and petals of the former and lip of the latter. L'Horticulture Internationale sent two very fine Vanda Sanderiana, the flowers large, three divisions delicate rose, the other two darker-the lip darkest of all; Catasetum revolutum roseo-pictum and C. revolutum aureo-maculatum, two first-cla-s varieties; and Odontoglossum crispum Triomphe de Rambouillet, one of the most beautiful of known varieties. M. Alf. VAN IMSHOOT showed an excellent variety of Miltonia Blanti Lubbersiana, Cypripedium Elliottianum

and Rothschildianum; Zygopetalum Wendlandi, with a large liphordered widely with white: Cypripedium × Massaianum • C. superciliare × C. Rothschildianum), with large flowers and a remarkable lip; Cœlogyne pandurata in great beauty. From the Royal Gardens at Laeken came a splendid Cattleya aurea, with three well-developed blooms. Visitors to this meeting were agreeably surprised to find the large hall turned into an exhibition-room. There is therein now an interesting collection of ornamental plants, tastefully arranged in fancy pots and stands. On November 15 a Chrysanthemum show will be held there. On October 25 a Franco-Belgian competition for the twelve best varieties of Cattleya labiata autumnalis will take place in this building.

will take place in this building.

The jury decided, in future, to be more particular as to the plants to which they allotted rewards. On the occasion of which we now speak, first-class Diplomas of Honour were awarded to MM. Dallefirst-class magne for Odontoglossum Triomphe de Rambouillet; MM. Cabuzac for Leclio-Cattleya × illuminata; M. Linden for Catasetum spendeus var. aureo-maculatum (all the above were $\dot{\alpha}$ Tunanimiti); M. Linden for C. revolutum var. roseo-punctatum; and M. Coppens for Cattleya Eldorado var. A second-class Diploma was allotted to M. Linden for Catasetum fimbriatum var. Cogniauxi. The following first-class Certificates of Merit were allotted to M. Van Imshoot for Coclogyne pandurata (à l'unanimité); MM. Lucien Linden et Cie. for a collection of Cattleya labiata (Warocqueana), à l'unanimité par acclamation, and again for Lælia priestans; to M. Linden for Vanda Sanderiana; Dr. Capart for V. Sanderiana; M. Stepman for Cattleya labiata; for C. aurea from the Royal Grounds, Lacken; and for Cypripedium Massaiamm to M. Van Imshoot. A second-class Certificate was awarded to M. A. Van Imshoot for Miltonia Lubbersii,

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By G. Woodgate, Gardener, Rolleston Hall, Burton-on-Tren .

Gooseherries are greatly in request both for tarts, for preserving, and for dessert. I have, therefore, selected six varieties of each colour. Reds: Companion, Clayton, Conquering Hero, Dan's Mistake, Duke of Sutherland, and Red Champagne. Yellows: Broom Girl. Candidate, Catherine, Glory of Rateliff, High Sheriff, and Leader. Greens: General Markham, Green Overall, Green London, Green Walnut, Gretna Green, and Lofty. Whites: Atma. Antagonist, Carcless, Freedom, King of Trumps, and Lady

Figs.—Brown Turkey and White Marseilles are two varieties which succeed well against a south wall, but require some kind of protection during the winter.

Grape Vines, if planted against walls having a south or south-west aspect, will produce a large quantity of fruit in favourable seasons, which though not sufficiently ripcned for dessert, is suitable for making first-class wine; Black Cluster, Pitmaston White Cluster, July Frontignan, and Royal Muscadine, are four hardy and useful kinds.

Quinces and Medlars.—The three varieties are Appleshape, Pear-shape, and Portugal; the last-named makes the best marmalade, but does not produce its fruit so freely as the other two. Of Medlars, the two best varieties are Dutch and Nottingham; the former produces the largest fruit, but the latter has the best flavour. Quinces and Medlars should be left on the trees until sharp frosts occur. The Quince does not keep well for more than two months after being gathered. Put sufficient of the soundest of the fruits away to last that period. They should be stored in a dry, cool room, but not with other dessert fruits, as the aroma of the Quince secuns to attach itself to other fruits. The remaining part of the crop of Quinces should be taken into the kitchen. When Medlars are gathered, dip the stems in strong brine, as a preventive against the attack of mould. The fruit should afterwards be thoroughly dried, and then stored in the fruit-room, placing the fruit singly on shelves with the eye downwards.

Nuts and Filberts,—Atlas Cob, Kentish Cob, and red and white Filberts, are good varieties. A few plants of Cosford and Pearson's should be planted among the others, as they produce such an abundance of male catkins. Of Walnuts, Dwarf Prolifie is a good kind to plant, as it produces nuts much carlier than other varieties. Another good one is thin shelled, the nuts of which are well filled, and of good flavour.

Caterpillars of various kinds are most destructive to hardy fruits, and every means should be taken to reduce their numbers. Put pieces of grease-proof paper, 6 to 8 inches wide, tightly round the stem of fruit-trees, choosing the smoothest portion of the bark between the lowest branches, and well above the soil. On this place a thin layer of a sticky composition, as Horne's Fruit-tree Dressing, or one of the many kinds that are advertised for that purpose. Young standard trees which have any supports attached to them must have some composition placed round these also. In the case of espaliers, all the supports which enter the ground should be given a layer of the composition at a point just above the soil. The composition will require renewing during the winter, for the bands should be kept on until March.

THE KITCHEN GARDEN.

By CHARLES HERRIN, Gardener, Dropmore, Maidenhead.

Storing of Calinary Roots, -Beetroot being a rather teader root, I have already advised its being lifted and stored, but where the roots are still in the ground no time should be lost in getting them under cover, or some of them may be injured by frost. Carrots up to the present time have continued to grow, making early lifting unadvisable, especially as a few degrees of frost do not injure the roots. If the crop is to be stored in the root-house they should be carefully drawn. adherent soil rubbed off, and the tops cut off about half an inch from the crown. As the Carrot is more liable to decay than the Beetroot, more care becomes necessary in storing them, and some dry earth should be used for separating the layers of roots. A Carrotheap may form a bank against a wall, or a cone standing free on the floor; but in whatever fishion they are stored, the tops ought to be uncovered, so as to permit of the leaves growing, as they then will do, a little. Carrots may be left in the ground and protected from frost by means of litter or bracken, especially if there is no wireworm in the land. A covering of 6 inches in thickness will be sufficient to preserve them safely in any ordinary winter, as if slightly frozen they take no harm when left covered whilst thawing.

Salsafy and Scorzonera may be lifted and stored as advised for Beetroot, although these roots retain their freshness and good quality much better when allowed to stand where they have grown, a portion of the crops being protected in severe weather in the same method as advised for Carrots. These roots are, practically speaking, quite hardy, but a portion should be protected, otherwise lifting in frosty weather is difficult.

Jerusalem Artichokes.—Owing to the drought, these plants were very late in forming tubers, but they have made rapid growth since the 'rains, and the tubers are sufficiently large for table-use. It may be stated that, so long as the tops remain green, the tubers are increasing in size. In any case, the roots should be left in the ground and lifted as may be required. I find that Sutton's White is a variety in every point superior to the old purple. A portion of the crop should be covered with litter, so that lifting may be rendered possible during frosts.

Crosnes.—The useful Chinese Artichoke, Stachys tuberifera, has not made its usual amount of growth this season, and the tubers are still very small; however, they may yet increase in size slightly if left in the ground, as they should always be, and lifted as required.

Various.—The maincrop Leeks should be well carthed up to facilitate the blanching of the stems, and being quite hardy plants, no other kind of protection from frost is needed. Cardoons should be similarly treated, or else swathed in hay-bands. Celery, if sufficiently advanced in growth, should be moulded up high when the earth is dry enough to use for this purpose, the tops of the ridges being given a sharp slope to shoot off the rain; and the higher the earth is piled up the less protection with other kinds of materials will be needed later on. Celery heads which are full grown may be earthed so as to cover the leaf-stalks and a portion of the lower foliage.

PLANTS UNDER GLASS.

By Jno. McIntyre, Gardener, Woodside, Darlington.

Gyclamens.—If these were raised from seed in the antumn of 1895 or early in the spring of this year, they should have been finally re-potted last August or early this was not done, it may now be done. A suitable compost for these plants consists of two parts fibrous

loam, one each of leaf soil and sharp river or pit-sand. Much care should be taken in the potting of Cyclamens, their large and fleshy roots being easily injured. While some plants require firm potting. Cyclamen will not thrive if potted too firmly. Having mixed the soil in readiness for a beginning being made, let the required number of pots be crocked with care, and let every one be clean and sweet, using either new or very clean pots and crocks. In re-potting use no rammer, but gently press the soil round the old ball. Those plants which are re-potted at this season will be useful late in the spring. In the case of corms which flowered last year, and were shaken out and planted out in cool pits or frames in April and May last to start afresh, if they were re-potted at the proper time they will now have become established, and more water may be afforded them, but this should be tepid. The degree of warmth applied to plants about to come into flower is 55° at night and 60° by day. Vigorous plants may be afforded some kind of artificial fertiliser; but plants which are not healthy and not growing kindly should not be supplied with a fertiliser, to do so being an error in treatment.

Bouvardius. — Those Bouvardias which, being planted out in frames during the summer, had the root-masses cut of a suitable size for being put into pots, may be taken up and potted. In doing this, do not disturb the roots much; and after potting place them in a temperature of 60°, keep close and shaded for a week, or till there is no longer any flagging; afford water once copiously, and then but moderately till they are established.

Azuleas.—If there is a good stock of small plants, some of those with very prominent flower-buds may be placed in a pit or house with a temperature of 55° to 65°. They will flower if gently pushed on about the end of November, and one of the best for early blooming is Deutsche Perle.

Deutzias may now be lifted from the open ground and potted in readiness for forcing; the plants mature better for the check given by lifting them at this date.

Palms and Cycads, which were sent to exhibitions, or used for decorative purposes, and afforded stove treatment last month, should now be in active growth, and in need of every encouragement to make good growth, and to this end frequent applications of some trustworthy fertiliser should be made. It must be noted that I only advise this treatment for such Palms and Cycads whose growth, on account of their frequent use, has been checked at the proper season.

Miscellaneons Items .- Continue to push forward winter-flowering plants by placing them in positions near the glass, in a foreing-house which has a higher temperature than that of the stove. All flowering specimen plants, as Clerodendron, Ixora, Bougainvillea, Allamanda, and Dipladenia should now be at rest. It must be remembered that most of them must not be subjected to a lower temperature than 50°, water being very sparingly afforded, some growers indeed withhold it altogether. I do not agree with this practice, and think that water, in sufficient quantity, should be applied to keep the wood and roots from shrivelling. Dipladenias being tuberous-rooted plants, will mature their growths better if afforded scarcely any water, and must on no account be placed in a lower temperature than that of an ordinary plant stove. Bougainvilleas should always be treated as warm greenhouse or intermediate house plants. This plant will stand with safety during the winter months in a house having a temperature not falling lower than 45°, and water should be withheld till the time arrives to start the plants into growth. Allamandas, on the other hand, should have water sparingly applied throughout the resting season, and be afforded a temperature not lower than 55°. The flowering of the Ixora depends upon the thorough ripening of the shoots; keep the plants therefore on the dry side, in a temperature of 60°, and as soon as the shoots are ripe, cut these hard back.

THE ORCHID HOUSES.

By W. H. WHITE, Burford, Dorking.

Dendrobiums.—By the time this note appears in print most of the evergreen section of Dendrobium, such as Farmeri, thrysiflorum, densiflorum, Schrodere, Griffithianum, chrysotoxum, and its variety suavissimum, will have finished their growth for the season. This will render their removal to the coolest part of the intermediate-house a matter of prudence. The species above-named should not be severely dried off as is proper for the deciduous species, but they should be sparingly watered occasionally so as to keep the foliage fresh-looking, and the psoudo-bulbs from shrivelling. The rare

D. Harveyanum will now have begun to rest, and a cool place in the East Indian-house will be a suitable place for the plant during the winter. The same place for the plant during the winter. The same conditions will likewise suit D. Treacherianum. Dendrobium sulcatum is an evergreen species which seems to do best in an intermediate temperature at all seasous. If any of the above-mentioned species should have started again into growth, they should be kept in the warmer and lighter part of the house until growth is completed. Such Dendrobiums as Bensonie, erepidatum, Virgineum, eretaceum, Pierardi, Dalhousicannm, enosmum, fimbriatum, Parishii, albo-sanguineum, primulinum, superbum (maerophyllum), and its varieties Burkei and Huttoni, will not endure low temperatures whilst at rest, and the cooler part of the East Indian or warmer part of the Cattleya-houses form suitable wintering quarters for the plants. Dendrobium Bensonie, Parisbii, and albo-sanguineum require to be kept rather dry whilst at rest, but the others above named must be watered often enough to prevent induc shrivelling of the psendo-bulbs. Those Dendrobes that are more or less in growth at all times, viz., glomeratum, subclausum, Rhodostoma ×, Huttoni, sanguinolentum, purpureum, enreiflerum, triadenium, &c., should be encouraged to grow with plenty of heat and moisture at all seasons. Plants of D. Frymerianum as a rule do not thrive for any length of time in a stove like temperature, but succeed in the less warm Cattleya-house, where also D. cymbidioides will grow

Bolleas and Pescatoreas.—When well-grown, few Orchids are more highly appreciated than the Bolleas and Pescatoreas. Our plants of both genera are now freely growing, and are placed at the coolest part of the East Indian-hou-e, where the temperature during the winter does not descend below 60°. The plants are stood where they can be conveniently shaded, the least degree of sunshine or very strong light being injurious. The air around the plants is kept very moist always, and the plants are never allowed to become dry at the root. A pailful of tepid rainwater should be kept handy, and the growths dipped into it several times a day to prevent red-spider fluding lodgment on the foliage.

FRUITS UNDER GLASS.

By W. Pope, Gardener, Highelere Castle, Newbury. Midseason and Late Vineries .- If only a few bunches are hanging on those Vines which will be started early in the month of February, they should be removed with as much of the shoot attached as can well be spared, and placed in bottles filled with water. in which some chargoal is placed. The bottles must be so suspended that the bunches of Grapes will hang quite clear of them. The foliage on the shoots thus relieved of fruit may be cleared of leaves, but the ends of shoots that have been allowed to extend beyond the bunch should not be cut. For storing Grapes in bottles, a late vinery where fruit is still hanging on the Vines, or a cool dry fruit-room, should be selected. Vines are benefited by the removal of the erop of fruit, as it allows of free exposure of the Vines to the air. Should the wood not be thoroughly matured, mild artificial heat may be used by day till the foliage gives indications of falling off. In later houses, where the Grapes are expected to hang till the end of the year or longer, the atmosphere should be kept dry, but the temperature not so high as to cause shrivelling of the berries; 50° to 55°, with liberal ventilation on dry days, will be a suitable degree of warmth just before the foliage falls, a critical time for Grapes, and it is then that the fruit becomes very liable to decay and requires the closest attention on the part of the cultivator. If the foliage is very dense it should be reduced somewhat, taking leaves from the ends of the lateral shoets first, which will enable the meagre sunlight to have access to the bunches. The border should be covered with clean dry straw, or bracken, to prevent evaporation from the soil and dust, which if it sets on the fruit speils its appearance. No pot should remain in a vinery where Grapes are hanging if water must be afforded them. See that the directions given for covering ontsido Vine-borders is carried out.

Figs, Early Pottrees.—Trees which it is intended to force early, should be brought under cover, and be stored for the present in some cool, airy place, being careful that the soil does not get too dry. Any shortening of shoots, or relieving of crowded and weakly ones, may now be attended to, and the trees washed with a brush and soft-soap at the rate of 8 ozs. to the gallon of warm water. As soon as the foliage falls from the earliest of the trees growing in the border, the pruning and cleaning of the trees can be carried

out. As a dressing for Fig-trees at this season, Gishurst Compound and soap and water, thickened to the consistency of paint, with loam and soot, may be used. Trees growing too robustly should be rootpruned, removing in so doing some of the large roots, and covering the smaller and younger ones with fresh compost, which should be rammed firmly, and a mulch may be applied over all. Water will not be required till forcing begins. This is, or should be, a period of complete rest, the house being kept open whenever there is no severe frost.

Strawb rries for Forcing.—These plants must now be afforded protection, and cold-frames, Peach-houses, or the like cool and airy quarters do well for this purpose. They will require water at the root occasionally. Plants for late forcing should be plunged to the rim in coal-ashes, or cocoanut-fibre refuse, on an elevated spot in the frame-yard, and in very severe weather some bracken or litter should be laid lightly over them, removing it directly it is no longer necessary.

THE FLOWER GARDEN.

By Hedley Warren, Gardener, Aston Clinton, Tring.

Clematises. - As ornamental flowering climbers. Clematises are found among the more useful and generally popular plants; and the species and varie-ties are so numerous, that suitable positions for them for a display of bloom may be obtained during fully nine months. If used simply to cover walls, the evergreen varieties, C. montana and C. cirrosa, are suitable, and although their flowers are somewhat small, they are abundantly produced. The large-flowering varieties especially should receive liberal manuring as surface-dressings, and not be dug over or disturbed at the roots. The pruning of the different varieties is a point in their cultivation which must be carefully studied, the spring and autumn flowerers requiring quite different treatment in this respect. These which flower on the old wood, and these are usually early flowerers, should not be pruned till after they have flowered, when any necessary pruning and training should be done; and those which flower on the current season's wood may be pruned in early winter, cutting back the shoots on old examples rather severely, so as to obtain an abundance of young flowering-shoots. The training of all varieties should not be neglected, or a tangled mass will result that will defy the efforts of the gardener to unravel; but after the long shoots are laid in, in the desired direction, on fences, arches, walls, &c., and to the desired length, some to reach a foot or so from the ground, some half-way to the top, and others to the top, they should be left alone, too severe training spoiling the effect. If stations are to be made for Clematises, the land should be wellmanured and deeply-dug-putting at the least a 6-inch layer of half-rotten, rich dung at the bottom of each trench or hole. In heavy soil the drainage should be carefully seen to, adding rubble, sods, &c. : in light soils, on the contrary, no extra precaution in this direction is necessary. The following selection in this direction is necessary. The following selection of varieties in their various sections and order of flowering may be helpful to those who are intending to plant during the present season.

Patens section (flowering from May to June).—Albert Victor, lavender, pale bars; Fair Rosamond, blush-white, red bars; Lady Londesboro, silvergrey, pale bars; Miss Batemun, white, one of the best; Mrs. Quilter, pure white, very fine; Sir Garnet Wolseley, pale blue, plum bar; The Queen, mauveviolet, very large bloom. The growths made in this section of plants should not be pruned at all, but when too numerous, remove entirely all wood not required, retaining the best-matured growths at their entire length.

Plorida section (flowering from June to July).—Belle of Woking, silver grey, good double; Countess of Lovelace, bluish lilae, very attractive; Duchess of Edinbro, white, double, vigorous, and fragrant; Enchantress, double white, flushed rose; John Gould Veitch, lavender-blue, double, very fine; Venus Vietrix, pale lavender, double, very good. In pruning, treat as in the Patens section.

Lanuginosa section (flowering from June to October).—Anderson Henry, creamy white, very fine: Duchess of Teek, white, mauve bar: Fairy Queen, pale flesh, pink bar, very large; Lady Caroliue Nevill, blush, lavender bars, good: Lawsoniaua, reddish purple, very distinct: Louis Vau Houtte, violet purple, dark veins: Mrs. Hope, lavender, large, fine form: Princess Beatrice, silvery lilac, magnificent variety: Reine Blanche, mauve, lighter bar, good. Plants in this section should be but moderately pruned.

Jackmanni section (flowering from July to October).—Alexander, pale violet, free: Gipsy Queen, velvety purple, free and good; Jackmanni deep purple, very popular variety: Jackmanni superba, an advance on the former: Lilacina floribunda, pale lilac, six-petalled, good: Madame Edouard André, velvety crimson, unique: Magnifica, reddish purple, red bars, very fine: Rubella, claret, free, very distinct: Star of India, reddish-purple, red bars, good; Velutina purpurea, mulberry, distinct. Plants in this section should be severely pruned, in most instances to within 12 or 14 inches of the soil.

Vitivilla section (flowering from July to October).— Lady Bovill, grey-blue, cupped, very fine: Madame Thibaut, lilac, red bar, good; Mrs. James Bateman, pale lavender, veined: rubra grandiflora, rich claret, distinct: Thomas Moore, rich violet, white stamens, good: Venosa, an attractive striped variety. In pruning, treat as in Jackmanni section.

Montana section (January to May).—The varieties in this section are not numerous, montana being the most popular variety. Although indivisa lobata is classed with this section, it is not hardy, and should be grown only in a greenhouse or conservatory, where it usually thrives and produces an abundance of small star-like flowers: it is also evergreen.

H-rbaccous section (flowering from June to September).—Coccinea, vermilion, interior of flower yellow; Davidiana, of shrubby growth, lavender, fragrant; integrifolia, bluish-violet, good; recta, white, scented, a good variety; recta angustifolia, white, foliage small. Although plunts of this section are seldom seen, they should be included in every collection of herbaccous plants, however small.

THE APIARY.

By Excent

Extra Covering for Bas.—I have previously mentioned that second-hand Government blankets make good quilts to cover the frames with in winter, three thicknesses being tacked together, with a small proportion of flaked naphthaline sprinkled between each before being sewn; and in addition to this, a very simple and inexpensive plan is to place a few newspapers or sheets of brown-paper over the quilts, to add to the warmth, and to take the place of extra wraps that may be required as the weather gets colder; and leaving out the question of expense, there is but little doubt that paper will keep the frost from penetrating into the hives to a great extent, and will also keep the temperature of the hive fairly even, if the bees are strong, and too many frames are not allowed to remain, otherwise the bees scattered over a larger space must suffer in consequence as the cold a larger space inust suiter in consequence as the cold weather comes on. And I would strongly advise all beckeepers not to open any hives in cold weather, as harm must be done in doing so, I may mention that I purchased a few days ago, two old rick covers in very good condition for a few shillings from a local dealer, and these when cut up made good quilts, and were quite sufficient to make, after three had been put together, quilts enough for covering sixty or seventy stocks, which shows how very cheaply coverings can be secured by a little forethought before purchasing; and in addition to cheapness the very small proportion of tar in the cover tends to keep moths and other insects away.

Feeding.—On examining an apiary I found that one of the sticks of driven bees had not taken down any of the syrup that had been given to them, owing to a fault in the feeder, and as there were pleoty of bees in the hive I thought it worth while to try and save them if possible, and firstly took away several frames, leaving them five filled with foundation, to keep the bees in as small a space as possible to keep them warm.

I then placed on a "Canadian rapid feeder" filled with warm syrup, which I carefully covered up with thick quilts, cushions, &c. after placing hot bricks on the top of the feeder, to keep the temperature at its normal height, and so encourage the bees to take down the syrup. If I had not done this, they would not, in all probability, have taken down cold syrup so late in the season. In a few days I found they had taken downall the syrup, and after filling the feeder again. I found this was also taken down, and the combs sealed over, and the stock is now strong enough to stand the winter with the aid of a candycake made from a receipt which appeared in a previous article. In addition to this, I placed in the hive at the back several partly-filled 1 lb. sections. I do not recommend this without it is carried out very carefully and without delay. I have tried this as an experiment, otherwise I should have had to unite them to another stock, which I was anxious to avoid

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER. Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR NOVEMBER.

Nov. 1 Royal Horticultural Society of SUNDAY.

Nov. 2 Chrysanthemum Show at Kennington Park MONDAY, National Chrysanthenium Society's Jubilee Exhibition (four days).

National Chrysanthemum Society's Jubilee Banquet at the Hotel Metropole. Chrysanthemum Show at Sonth-TUESDAY, ampton and Eastbourne.

CORRECTED AVERAGE TEMPERATURE FOR THE EN-SUING WEEK, DEDUCED FROM OBSERVATIONS

OF FORTY-THREE YEARS, AT CHISWICK -45.1°.

HITHERTO the processes and Baeteria in Garmethods of the agriculturist have dening. mostly been of a cruder, rougher

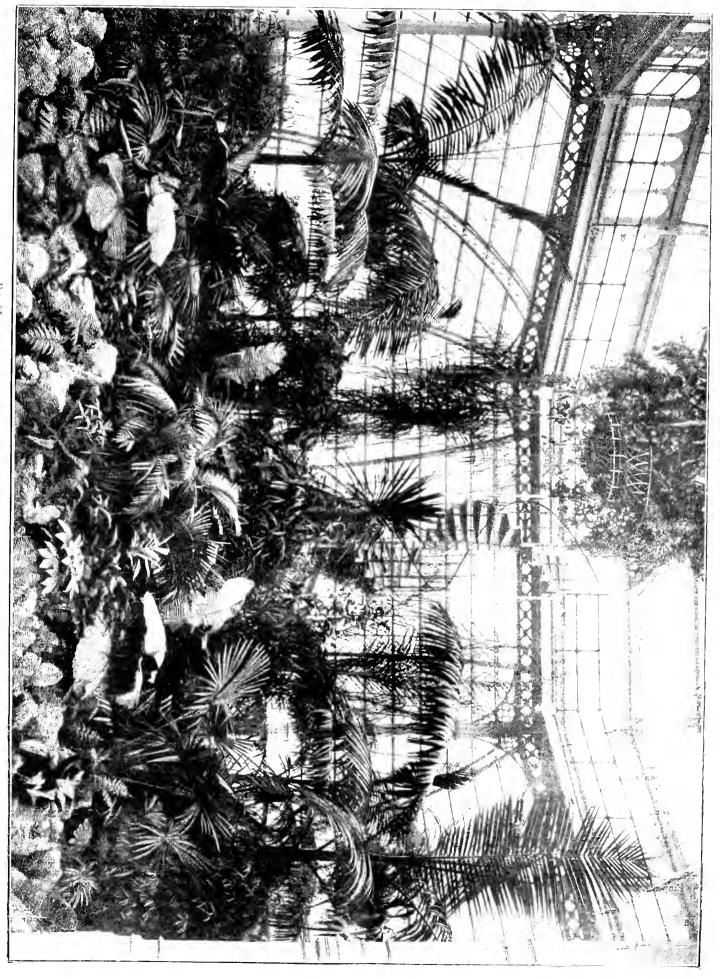

character than those employed by the gardener. The scale on which operations are carried out in the two cases suffices to account for this difference. There are, however, indications that the differences we have alluded to are becoming obliterated, and that in the future we may have to look to the farmer rather than to the gardener for the finer applications of science to practice. The depression through which agriculture is passing contrasts with the generally prosperous condition of horticulture. Whilst arable land is going out of cultivation, the growth of crops under glass has increased, and is increasing, in a way that seems marvellous, but which will be still more remarkable when market-gardeners see their way to the profitable use of the electric light. The depressed state of agriculture may ultimately turn out to be a blessing. It is already stimulating research and enquiry, it is promoting experiment, it is enforcing the adoption of less wasteful methods, and the more careful adaptation of means to ends; and hence it is, we say, that agriculture bids fair to overtake horticulture in the application to practice of scientific methods and procedures. Agricultural training and education are also in a more forward state than is the case with horticulture, and the leaven thus infused into the agricultural body is certain to work for the benefit of the community. Climatal difficulties the gardener can meet better than can the farmer, but it looks as if in the not remote future the expenditure by the farmer on manures and fertilisers will be rendered largely unnecessary. Instead of tons of farm-yard manures, it will suffice to employ a few ounces per acre of the right kind of fertiliser, applied at the right time, and with a due regard to the circumstances of the case. Again, the presence or absence of some particular microbe or bacterium may make all the difference in the way of successful cultivation of particular plants. Our old friend and valued correspondent, M. CHARLES NAUDIN, some years since, threw out the suggestion that the difficulty of growing particular plants in certain countries, or on certain land, was due to the absence of the right kind of bacterium. Actual experience gained since this suggestion was thrown out has tended to confirm its substantial correctness. The introduction, on a commercial scale, of a substance known as "Nitragin" is a case in point. The nature of this nitragin, the method of preparing it, and its use in agriculture, are explained in a paper by Dr. J. A. VOELEKER, in the last number of the Journal of the Royal Agricultural Society.

The presence of little nodules on the roots of

leguminous plants has long been known to botanists. Chemists, and practical farmers, on their side, have long known that nitrogenous manures applied to Clovers and other leguminous plants, produce no proportionate benefit; and further, the farmer has long been aware that a leguminous crop, such as Clover, was a good precursor to Wheat. The chemist showed that this was due to the actual accumulation in the soil of nitrogenous matter over and above what was supplied in the manure. To find out where this excess of nitrogen came from, was the problem agricultural chemists then attacked. In spite of the preponderating amount of nitrogen in the air, chemists and physiologists are unanimous in asserting that, as a rule, no nitrogen in a free state is assimilated from the atmosphere. The leguminous plants form an exception-and that exception had to be explained. Briefly, it may be said that the clue was furnished by these little nodules on the roots, which had long since attracted attention. Improved microscopes and specially improved methods of preparation and investigation, revealed the fact that these little hodies were the homes of countless organisms of minutest dimensions, and generally classed as bacteria, though MARSHALL WARD gives a different identification. The word "microbe" is, perhaps, the best to use at present, as it affirms nothing as to their nature. Precisely what they are is an important point to dotermine, but, for the moment, it is a matter of less consequence to the cultivator than to understand what they do.

Their work, then, consists in enabling the plant which gives them a home to utilize the nitrogen by which it is surrounded, but of which, without their aid, it could make no use. These things being proved, the thing next was to turn them to practical account.

In the paper before us, Dr. VOELCKER briefly narrates how this has been done by HELLRIEGEL, Nobbe, and others. Referring the reader to the paper for full details, it must suffice here to state that the main objects of the experiments have been, first, to isolate and to cultivate the particular microbe required (for each genus of Leguminoste appears to have its own microbe); and then, secondly, either to infiltrate the soil, or to inoculate the seed with that particular microbe. It is obvious that few farmers or gardeners have the means or the leisure to carry out the delicate work of examining, isolating, and cultivating bacteria. That must be left to professional experts, and they have, as we have already stated, been so successful, that the substance known as Nitragin is now manufactured on a commercial basis. It is very unfortunate for English people, we may remark incidentally, that this term should have been employed, as it will constantly be confounded with the well-known nitrogen. In Germany, where the word "stickstoff" is employed to designate what we call nitrogen, no such confusion will arise. Nitragin is a gelatinous liquid, sold in bottles at a cost of about 2s. 6d. a bottle, the quantity in each vessel being sufficient to inoculate about half an acre. The seed may be thoroughly sprinkled with the diluted nitragin, or a quantity of soil may be infected with the liquid, allowed to dry, and then spread over the soil to be infected, or carefully worked into a depth of about 3 inches. It is obvious that a good deal of experiment, under varied conditions, has yet to be done before the practical value of the method can be adequately estimated. For this purpose, Dr. Voelcker has commenced a series of trials at the Woburn Experimental Farm,

which we had the pleasure of seeing recently, and the results of which will be eagerly awaited. In the meantime may we hope that similar experiments be made next season at Chiswick, in the case of Peas and Beans. A half-crown bottle of Nitragin and an hour or two's work are, as it seems, all that is required, and the results of one season's growth of a row of Peas and one of Beans, with a check-row untreated, would probably suffice to show whether the experiment were likely to be useful to horticulturists, or worth continuing for a second season. Up to the present time seventeen varieties of Nitragin have been prepared for as many agricultural crops. French Beans and Scarlet Runners are not in the list, but as these are of great consequence to gardeners, we have no doubt the deficiency could speedily be supplied.

In the light of these discoveries, we may well ask, What are we coming to? A pinch of fertilising dust, a few drops of bacterial fluid, an hour or two's exposure in the twenty-four hours to the electric light. These are among the methods by which the "new cultivator" will baffle the antagonism of climate, neutralize foreign competition, diminish the cost of production, increase the amount of the crop. Can all this be true? Yes; we have no doubt that substantially it will be so, and great is the responsibility of those who do not avail themselves of the opportunities put before them.

ESSEX COUNTY SCHOOL OF HORTICULTURE. -A course of elementary instruction in the science and practice of horticulture will be given at the Technical Laboratories, Chelmsford, during the last three weeks in November. Students must be resident in the county, and must either be employed in gardens, or intending to be so. Eight or nine hours daily are devoted to the work; of these two hours are occupied by lectures and didactic teaching, two hours in the laboratory, three hours in the garden or greenhouse, one hour or one hour and a-half are employed in reading. In the first week soils in relation to plant life are treated of, in the second fruit culture, and in the third planting and propagation. We need not detail the instruction given in the lecture room, but we may specify the work that is done in the garden as follows :- Study of different kinds of soils, mixing soils for pot culture; demonstrations and practice in digging and trenching; preparation of heds for herbaceous plants; preparation of ground for fruit trees; drain-making demonstration and practice; planting fruit trees and bushes; pruning fruit trees and bushes; practice in root-pruning; visit to a fruit farm; training of trees, nailing of wall trees; pruning of Vines; visit to nurseries and private gardens; planting herhaceous beds; planting bulbs and spriog-flowering plants; potting bulbs for forcing; preparation and insertion of cuttings of decidnous and evergreen shrubs; transplanting and pruning shrubs. The programme is an excellent one, but one better adapted, as we think, to a lad who has been employed in garden work for twelve months than for an absolute novice, who would find it hard to see the significance of what he was doing, and harder still to keep up day by day with the instruction given.

FLORAL DECORATIONS IN PARIS.—One of the most ingenious decorations on the occasion of the Russian Emperor's visit, according to the Rerue Horticole, consisted in attaching flowers to the stalks of Grapes (raftes). In sating Grapes, the berries are picked off and the branched stalks left on the plate. Some ingenious decorator had the idea to take these bunch-skeletons and attach to their free tips small paper flowers. The bunches were tied on to the trees, so that they looked like pyramidal inflorescences. The designer must at least be credited with ingenuity. The glazed paper flowers tied on the trees in the Champs Elysées were simply

circular discs of paper stamped or cut into four or five lobes at the circumference. Two of these were placed in apposition, but in such a way that the lobes of the one alternated with those of the other, as the sepals of a flower would do with the petals. The paper was then folded in half or in quarters, and so a more or less funnel-shaped flower was formed. We may commend these devices, not indeed to our horticultural societies, which, we trust, will keep free from such things, but to the managers of the flower-battles, which are now becoming popular.

THE CARDIFF GARDENERS' ASSOCIATION held a meeting at the Temperance Club, St. John's Square, Cardiff, on Tuesday evening, October 20, Mr. A. Pettigrew presiding. Mr. Joun Storrie delivered a very interesting address, which he illustrated by means of specimens under the microscope. The subjects of Mr. Storrie's address were "Cyclosis, or Circulation of Cell Sap," "Low Vegetable Organisms," "Ancient Vegetables," and the "Formation of the Coal Measures."

JAPANESE FLOWER ARRANGEMENT.-In the current number of the Studio, Mr. JOSIAH CONDER has an article on the Japanese method of arranging flowers. Instead of crowding a mass of more or less incongrueus flowers into one meaningless bouquet, where no individual flower has a chance of displaying its form and its characteristics, and where the flowers are so jammed that the wires which support them are concealed, the Japanese arrange their flowers singly or loosely. From a base which is really, as it appears to be, a support, rises one principal branch, and from it diverge one or more secondary branches, now ascending, now spreading, now reflexed, so that when analysed the arrangement is seen to be a more or less close copy of the natural growth of a shrub or tree, each with its own peculiarities modified by external circumstances, and the growth in one direction balanced by that in another.

ECONOMIC ENTOMOLOGY.—Messrs. Wesley & Son's catalogue, No. 126, contains a long list of publications relating to injurious and useful insect, which will be of interest to students of the subject. The address of Messrs. Wesley & Son is 28, Essex Street, Strand.

CATTLEYAS AT BRUSSELS.—A "match" took place on Sunday last at the Horticulture Internationale between M. Lucien Linden and M. Dallemagne, of Rambouillet, France. The two competitors were to present a certain number of varieties of Cattleya labiata var. autumnalis imported within the last six months, and the jury was called on to decide which was the better collection, having regard solely to the quality of the flowers. Voting was by ballot, and when the result was announced it was found that all the voters were of opinion that M. Linden was the winner of the "match."

FRUITING POMEGRANATES.—Mr. E. C. A. BYRONS records in the *Garden*, p. 306, the production of no fewer than nine Pomegranates from a tree growing against the south wall of a house. This is so far as we know, the first time the Pomegranate has been recorded as fruiting in the open air in this country.

FRENCH NATIONAL CHRYSANTHEMUM SO-CIETY.—The first meeting of this newly-formed society's floral committee was held at Lyons on the 21st inst. The exhibits were not numerous, but certificates were awarded to the following varieties: -National Chrysanthemum Society's Jubilee (Calvat), a large pinkish incurved Japanese; A. Verlot (Calvat), Aug. Nonin (Calvat), Lucile Mathieu de la Drôme (de Reydellet), and Madame Fleur de Lis (Bency). Eight other varieties were the recipients of "felicitations." The society has just issued the second number of its official publication, Le Chrysanthème, containing details of the conference to be held at Bourges on Nov. 7, reports of the committee meetings, several essays on various subjects connected with the flower, a list of donations to the society's library-from a perusal of which we wonder when some of our leading English Chrysanthemum societies will consider it a part of their programme of

operations to do likewise. Chrysanthemum literature is now becoming so extensive that unless an attempt be made soon, great difficulties will be encountered in securing some of the old and scarce treatises that have been written by authors at home and abroad. As instances of which we should feel curious to know how many present-day cultivaters there are who have ever seen RUPRECHT'S work, Ucber das Chrysanthémum Indicum, published in Vienna sixty-three years ago; George Taylor's treatise published forty-five years ago; or the more modern ones of Lebois of Paris, and John Salter of Hammersmith. These should all be, as some are, in the Lindley Library, access to which, it may be remembered, is not confined to Fellows of the Royal Horticultural Society, but also to members of the Chrysanthemum Society-indeed, subject to certain regulations, to the public at large.

NATIONAL CHRYSANTHEMUM SOCIETY: Oct. 28, 1896.—The Floral Committee met on the above date, and some excellent varieties were staged, and several First-class Certificates of Merit were awarded. To Mr. C. BECKETT, The Gardens, Aldenham House, Elstree, came Japanese Royal Sovereign, a large deep yellow incurved variety, which may be described as a greatly improved W. H. Lincoln; to Messrs. H. CAN-NELL & Sons, nurssrymen, Swanley, for Japanese Mrs. J. M. Lewis, a broad petalled white variety, in the way of Mdlle. A. D. Gilbert, but yet distinct enough from it; to W. SEWARD, Esq., The Firs, Hanwell, for Japanese John Neville, bright orangered with golden reverse, very bright in colour, and distinct; and to George Seward, the surface of the petals dark erange, with a pale yellow reverse. very pleasing in colour. To Mr. NOR-MAN DAVIS, Framfield, Sussex, for Japanese Western King, a fine broad-petalled incurved white variety, rather small, but of high quality; to Japanese Nathan Smith's White, a large full white flower, with drooping florets, the petals horned at the points, and to Modesto, a magnificent yellow Japanese, as glorious in colour as it is fine in size and build, much incurved and very deep. These were raised by Messrs. NATHAN SMITH & SON, Adrian, Mich., and we thus see that America and the Colonies are in the front rank in producing new varieties. A similar award was made to Mr. W. Wills, Earlswood, Redhill, for Australia, bright violet amaranth, with a silvery reverse, very large and full, a New South Wales seedling. A yellow-flowered hairy variety, named Lescadie Gentils, from Mr. QUETIER, Orleans, the committee wished to see again, as they also did a large white incurved variety, named La Perle d'Algeriæ, also a white, which Mr. C. Gibson, The Gardens, Morden Park, stated is a true incurved. A white Nerine was shown by Mr. T. S. WARE, of Tottenham.

THE JEPHSON GARDENS, LEAMINGTON.—We understand that Mr. T. W. Dell, who has for several years held the position of head-gardener at the Jephson Gardens, Leamington, which has hitherto been managed by a committee, has been appointed to the important office of head-gardener and parksmanager, under the Leamington Corporation. The municipal authority having obtained powers under the New Town Improvement Bill, will take over the gardens on November 1 next.

DESSERT APPLES AS DECORATIONS. - M. CHARLES BALTET, of Troyes, describes how, at certain of the banquets recently held in connection with the recent Franco-Russian fêtes, French horticulturists provided fruit not merely of the finest quality, but prepared in a fantastical manner, but showing considerable patience and care. He mentions how the delicate Apple, Calville Blanc, gathered in the fertile regions of Rosny, showed a carmine glow upon its pearly surface, thanks to the art of the grower, who had moistened the skin in summer with a damp sponge; the drop of water formed a blister, and the colour developed under the sun's rays. Another little arrangement also astonished the guests: the Russian eagle spread its wings in green on the Alexandre Apples, in white on the Calvilles; a paper cut with the desired silhouette was stuck on to the skin, forming a

screen which the snu's rays did not penetrate, and at harvest-time, on raising the paper, a non-coloured design was apparent. By reversing the process, a piece of paper covered the fruit, leaving the pattern only exposed to the sun, so that the design appeared in red.

MR. JAMES GOLDIE speaking, in a letter, of certain incidents in the life of his father, the late John GOLDIE, says :- "My father visited this country (Guelph, Ontario, Canada), in 1817, returning to Scotlind, I think, in 1818. He came back again in 1819 and remained, I believe, till 1821. In 1824 he made a collection of plants, trees and shrnbs for the Botanical Gardens that were then being constructed in St. Petershurg, Russia, and went there with them. He was connected with the gardens for some time. He travelled in that country collecting novelties, and introduced many fine things. He afterwards re-visited Russia and Siberia to investigate the rich botanical wealth there. He came to Canada in 1844 with his family, and resided at Ayr till his death. Nearly all of his journals and notes of travel in the various countries he visited were lost by the burning of his house." Mechans' Monthly, October.

GERMAN GOVERNMENT FRUIT DEPÔT. - A correspondent of the Dundee Advertiser thus speaks of the institution described in our columns, by our Berlin correspondent, some time since :- "It was established about three years ago, and exists for the purpose of assisting the fruit-growers of Germany. They send samples of their fruit: these are shown to fruit-dealers. A bargain is struck if the parties, through the medium of the Department, can fix a price, and the fruit delivered. This is done free of charge, and entirely with the object of developing the trade. So far it has been appreciated by seller and buyer alike, and has met with entire success. Other depôts are to be started, if, in fact, they have not already been established, in different centres throughout the Fatherland."

DUTCH COMPETITION IN FRUIT.-Were the freight from Helland as high as the freights paid by the home-grower, it would be a big obstacle in the way of foreign competition. But, while railway service and freight are about as unsatisfactory in Scotland as they could well be, different companies compete with each other to carry foreign produce, and the result is extremely low rates, which enable the foreigner successfully to compete with the homegrower. From Rotterdam, for instauce, to Hull, it is 230 miles, and the freight is only 24s, per ton. The passage takes eighteen hours. As stated in my last article, it is 91 miles from Hull to Manchester, and the freight is 23s. 9d. Fruit can be in the Manchester market in something like twenty-six hours after it leaves Holland, the whole distance covered being 321 miles, and the freight 47s. 9d. From Rotterdam to Leith it is about 380 miles. The ordinary passage is thirty hours, but the Britannia, one of Messrs. Gibson & Co.'s boats -the fastest hoat trading between the Continent and Scotlend-has done the passage from quay to quay in twenty-seven hours. The freight on Strawberries is 30s. per ton; Currants, 35s.; and Gooseberries, 20s. Special trains convey the fruit on the arrival of the steamers to different towns throughout the country. The Dundee boat comes from Rotterdam in thirty-six to forty hours. It leaves on Saturday, and is in on Monday. Currents are charged 40s. per ton, and Gooseberries 25s. If the fruit were sent to Scotland by Harwich, the time would be considerably lessened, though, no doubt, the freight would be increased. Fruit leaving Holland at night is in Harwich next morning, and could be in the Glasgow market twenty-four hours or so after it is shipped. The full significance of these figures cannot be thoroughly understood until they are put alongside the rates charged in Scotland, and I intend in a subsequent article on foreign competition to make a comparison. Dundee Advertiser.

FARMERS AND THE INCOME TAX.—The Board of Agriculture has this week issued a leaflet of great interest to all connected with farming—as, by the

way, it is to all of us. The subject was noticed by the Board in 1893, and at the time gave much satisfaction; the issue of the present leaflet is as opportune as it is of value, for the matter has been carefully revised and brought up to date. Advice is given to farmers under all the schedules, and also in cases where there has been a remission of rent by the landlord, who, in turn, has something placed to his credit where there has been deterioration or destruction of crops. The farmer is shown how to proceed in procuring a return of money paid to the Receiver of Taxes. Generally speaking, the four pages constituting the leaflet are of interest to all connected with British husbandry, and copies may be obtained, post free, on application to the officials of the Board of Agriculture, 4, Whitehall Place, S.W. It is to be presumed that market-gardeners have the same statutory rights as farmers or 'persons occupying lands for the purpose of husbandry only.'

LONDON PRIDE.—It has been assumed on very slender foundation that Saxifraga umbrosa received the name London Pride because it was a favourite plant of London, the famous nurseryman, who died in 1717. London is further supposed to have been the means of introducing it to cultivation. In the current number of the Journal of Botany, Mr. Britten points out that it was common in London in Gerard's time, and that it "flourished exceedingly" in his garden. Gerard says it was called of our London dames "Pratting Parnell;" whilst Parkinson says some of our English gentlewomen have called it Princes' feather. The name London Pride attached to the plant before the end of the 17th century.

BELGIAN FRUIT CULTURE.—The Dundee Advertiser is publishing a series of articles on small-fruit culture in Belgium. One shows how by labour and diligently tilling small areas the peasantry have converted what is naturally a very poor soil into productive land. Strawberries and bush fruit are largely grown, together with Onions and other vegetables. The English market is, of course, largely catered for; and some Scotch jam, it is hinted, has a basis of Belgian Carrot—but it is a question whether the fruit would not be cheaper than the Carrot!

HORTICULTURAL AGENCY.—Mr. JOHN S. IRELAND, who is so well known in the North among gardeners, foresters, and agriculturists, has commenced business as a Horticultural and Agricultural Agent, at 122, George Street, Edinburgh. Mr. IRELAND is already entrusted with several important agencies, which his great experience and business abilities will enable him to carry on successfully.

A ONE MAN EXHIBIT OF TULIPS IN CORK, 1897.—The notice in the Cork press that Mr. W. BAYLOR HARTLAND, of Ardeairn, Cork, is giving a "one man exhibit" of late single self-coloured Tulips in May, 1897, for the benefit of Hospital Saturday Collection. It is unique for Ireland, and we wish the undertaking much success. The collection should be worth seeing.

THE NEW CONSERVATORY AT SEFTON PARK, LIVERPOOL.

WE have already (July 18, p. 66) figured the exterior of this building, the munificent donation of Mr. H. Yates Thompson, to the City of Liverpool. We now lay before our readers a view of the interior as furnished mainly by Messrs. James Veitch & Sons. The idea of Mr. Yates Thompson was to supply a building which should be not only a place of refuge and shelter during inclement weather, but one which should afford delight to the eye, interest to the student, and generally make life brighter, and, it may be, better. The whole space underneath the dome is filled with plants, skilfully arranged. Around the margin of this space a rockery has been built, some 3 to 4 feet high, entirely composed of tufa stone, brought specially from Matlock Bath for the purpose. This stone is well suited for this class of decoration, being porous, and partially honeycombed, which enables it to get quickly covered with small Ferns and mosses, thus giving a soft and pleasing tone to the

general effect. Rockeries of this stone have also been built flanking each of the entrances. Conspicuous among the plants in this central portion are four very fine specimens of Seaforthia elegans; they are from 20 to 25 feet high, and it is expected that in time they will grow about 10 feet more, which will bring them well into the dome, Detween these four plants are arranged varieties of Dracenas, Bamboos, Eucalyptus, Verschaffeltia splendida, Cocos, &c. The following is a list of the varieties in this central portion .- Chamærops excelsa, Sparmannia africana, Strelitzia augusta, Aralia trifoliata, Seaforthia elegans, Laurus camphora (Camphor-tree), Clethra arborea (Lily of the Valley-tree), Cocos flexuosus, Citrus species (Orange tree), Latania borbonica, and Bamhusa aurea. There are also two fine Dicksonia antarctica on the walk. Between the eight pillars of the dome are suspended large baskets containing various trailing plants. These are intended to relieve the openness of the great dome, and in a few years they will present a mass of delicate overhanging

A wide border runs round the entire building, the principal plants in which are the following:-Dracœna lineata, Rhapis flabelliformis, Glaziova insignis, Rhopala corcovadensis, Caryota Cunninghami, Kentia Fosteriana, Araucaria Rulei, Bidwilli, and elegans, Draeæna lineata variegata, Hedychium Gardnerianum, Pritchardia grandis, and varieties of choice greenhouse Rhododendrons. The climbers on the roof include the following varieties:-Cobera scandens variegata. Bougainvillea glabra, Stigmaphyllon ciliatum, Passitlora racemosa, Lapageria rosea, Myrsiphyllum asparagoides, Passiflora cœruleo-racemosa, Clematis indivisa lobata, Lapageria alba, Asparagus plumosa scandens, Plumbago capensis, Tecoma jasminoides, Bignonia chirere, Cissus rhombea, Passiflora Constance Elliott, Tacsonia exoniensis, Stauntonia latifolia, and Habrotha unus elegans. The building was erected by Messrs. Mackenzie & Moncur at a cost of about £10,000.

CHRYSANTHEMUM CHAT.

AGAIN we have entered upon the season so largely devoted to the worship of the Chrysanthemum, and one is led to reflect if its claims to such admiration in 1896 are less forceful than they were half-a-dozen years ago. It is evident at the outset that in almost all gardens the greatest floral effect during the next six weeks will be due to the cultivation of this eastern plant. There are, doubtless, other plants that, under special culture, are capable of affording blossoms in November, and it is happily not rare to see a house of Eucharis in bloom, or even a few Carnations, and a magnificent blaze of Pelargeniums. Salvias, Cyclamens, Heaths and Orchids, besides many other species, are also in bloom in more or less abundance. It may be remarked, too, that the possibilties in connection with the practice of postponing the flowering season of many plants by means of a "retarding" process, may far exceed our present knowledge of them. Still, we admit that at the present time it is not easy to point to a plant that might be grown out-of-doors for six months during the year that would repay for its cultivation by yielding a display of flower in the late autumn suitable for all purposes in the same measure as does the Chrysanthemum.

Persons who are not disposed to favour the attempt to thrust large blooms upon us, before Dahlias and even Roses have disappeared from our gardens, may have noticed that, until this week, there have been very few such blooms exhibited during the present autumn. The poor character of the September show held by the National Society was nothing unusual, but that held upon the 13th of the present mouth was also of very small extent; yet last year, an exhibition held at nearly the same date, was a distinct success. This fact may be taken to indicate that the plants are slightly later than usual—certainly later than last season; and this view is supported by the appearance of the various collections we have had the opportunity to inspect.

During the coming week the National Chrysanthemum Society will celebrate by the best means in their power the attainment of its Jubilee, and it is hoped that the exhibition at Westmiuster will be the largest and best ever held. A glance at the appointments on p. 528 will give some idea of the number of exhibitions that will be held during November, but that list only includes some of the more important of them, and probably a greater number of smaller events are omitted. Editors of horticultural journals will have some difficulty during the next few weeks in preventing each issue from becoming merely a Chrysanthemum number.

IN THE LONDON PARKS.

In most of the parks under the management of the County Council the usual autumn displays of Chrysanthemums are now open for inspection by the public. The liberal policy which is pursued by the Council in matters pertaining to the management of the parks and open spaces has been frequently referred to in the Gardeners' Chronicle, and an illustration of this is afforded by the Chrysanthemum exhibitions. The holding of these has necessitated the building of houses suitable to display the plants, in addition to the cost of raising them and of increasing the stock. That the privilege of visiting such floral manifestations, provided by the rates, is appreciated by a great part of the populace, is attested by the thousands of visitors to each of them, and the remarks that are made during an examination of the flowers.

Battersea Park is accessible to a very large population, by whom it is used with greater freedom than ever for most forms of recreation and amusement. The Chrysanthemum exhibition is held in a house in a spot known as the frame-yard, and close to the Albert Bridge entrance. The house is furnished with strict regard to general effect, and the result is first-rate. The pines are arranged in one group, which faces a broad path running along one of the sides. They are arranged to make three undulations, with good sweeps on the surface. At the back of the group have been trained tall plants on the rafters of the house, and at the side of the building to which the path adjoins, the same means to give at furnished appearance have been adopted. Such varieties as Margot, and similar ones, are trained to the rafters; and the Cedo Nulli varieties, and Sour Melanie, besides many others of similar character. have been tied down upon an improvised trellis to hide the wall as far as possible. At none of the parks has this been better done. The display was opened on the 17th just., and many of the blooms are more developed than in other collections, even incurved types such as Queen of England, Jeanne d'Arc, and others are nearly fully built up. Many varieties of the Japanese section are capital, partieularly Charlotte de Montcabrier, rosy-lilae in colour, and very distinct. President Borel, Sandower, Miss Dorothy Shea, and Florence Percy. The newer variety, Lady Byron, may be seen here as a first-rate deep Japanese flower of pure white. This variety especially is very fine at Battersea. only conspicuous variety of the Ancmone type is Descartes, and of the Pompon Mdlle. E. Dordan. Altogether, the exhibition provided by Mr. Coppin, the superintendent of this park, is the best we have seen at Battersea; and much credit is due to Mr. Wheeler, who has had charge of the plants throughout the season, for they are possessed of vigorous foliage, and individually present a good appearance.

Waterlow Park, at the top of Highgate Hill, is of smaller area than most of the others. It was a present from the late Sir Sydney Waterlow, and is composed of hill and dale throughout. A rustic bridge and waterfall have been constructed in this very pretty rendezvous since we last visited it, which, when furnished with suitable plants, is likely to prove a further attraction. In regard to the Chrysanthemum exhibition, and in comparison with other parks, Mr. Pallett, the superintendent here, has had both advantages and disadvantages, for the atmosphere at this elevation is decidedly more favourable to vegetative growth than

in Victoria, or Southwark parks, for instance. But the accommodation for housing the plants is insufficient, and it has been necessary to put a new roof on the old conservatory, the completion of which was not effected early enough to prevent the plants from being huddled together for a time in the small vineries. It has been finished now, however, and the display to be seen here is quite commendable. Many wellknown varieties could be mentioned as exhibited well. such as D. B. Crane, Louise, Phobus (one of the best smooth-surfaced flowers of deep yellow), W. Tricker, &c. Mrs. E. S. Trafford, on second crown buds, is a capital colour; Utopia is a finely-formed Japanese flower, florets slightly recurved, and cream coloured; Bride of Maidenhead shows very well, so does Madame Carnot and Mrs. H. R. Williams.

Finsbury Park.-Visitors to this particular parkone of the finest-are informed that the Chrysanthemum show will be found in the house that it has been held in for years-excepting three years ago, when the plants were arranged in a fine new house that had just been completed. Owing, we suspect, to the architect embedying in his plans his own ideas rather than those of a practical man, the house was found to be too high and otherwise unsuitable. It is now used as a conservatory for Palms and miscellaneous plants. The other house has a span-roof, is of a good length, but is not sufficiently wide. Last year, a path ran round the sides of the house, and the plants were arranged to face both ways. To provide a change, the exhibition now open is composed of one group with undulations on the surface, and a serpentine margin to the face. A path runs through the house upon one side. The show was opened to the public ou the 10th in t., and visitors have good reason to be pleased with its general character. When our visit was made, one of the most conspicuous varieties was Mrs. E. G. Hill, which, as tall plants at the back, carried a fine lot of blooms. Mrs. C. E. Shea, Madame Lacroix, Golden Beverley, Yellow Avalanche, Marquis de Paris, Florence Davis, and J. R. Pearson are only some of those that appeared to good advantage. Mons. Chas. Leboscqz and Descartes, both Anemone flowered varieties, are so good that they should be in every collection. The labels to the plants are printed ones, but the spelling upon them might be improved with advantage.

Victoria Park.-There is usually a fine exhibition made at this park. The superintendent, Mr. Moorman, has long been known as an enthusiastic cultivator of Chrysanthemums. The show is made in a fairly wide, span-roofed house. A path runs through the centre, which is faced on either side by a fine group of plants extending the whole length of the house. In the arrangement there have been obtained the usual sweeps or waves upon the surface, and the best effect possible has been secured. Mr. Large, the grower, has to contend with a vile atmosphere, but the plants have been well cultivated, and about 2000 are required to furnish the house, whilst another 1000 or so, we saw under an improvised shelter for re-placing extra-early flowering plants when they have passed. The collection upon the whole is rather later than some others, but there were many varieties with perfected blooms a week ago. We noticed Mons. Gruyer, a rather flat Japanese incurved bloom, with rose-coloured florets, and a straw-coloured centre, the reverse of florets very silvery. The new variety, Jno. Fulford, was not yet in bloom; Bride of Maidenhead, Mutual Friend, and the fine Lady Byron were good, also Robert Petfield, and Pride of Madford, a new Japanese incurved, with purple crimson florets, and silvery reverse, the florets being very broad; Gloire du Rocher is always an unusually bright colour in this collection. Miss Elsie Teichmann is a very large flower, with broad florets, slightly twisted and incurved. The colour as seen here is creamy white, but rather deeper towards the centre of the bloom.

Highgate Cenetery.—The Chrysanthenum has long since invaded some of our cemeteries with its presence A few days since we saw some hundreds of plants arranged in a house in the one at Highgate. It is said that they were grown with a view to displaying them to the public when visiting the graves of

their departed friends, but before the blooms have faded, they are sold in order to recoup the company for its ontlay. On one plant in this collection, there were flowers of both Mille. Lacroix and Mr. C. E. Shea. It will be remembered that the latter is a sport from the former.

(To be continued).

OLEARIA HAASTII.

No other flowering shrub of the year, has been so profuse and attractive as this New Zealand plant during late autumn.

Here the compact specimens are, as the photograph taken by Mr. W. Waite shows (fig. 96), literally covered with flowers, forming large ball-like masses of white.

The plant is well known, having been introduced in 1858 by Messrs. Veitch of Exeter, yet its popularity does not seem to have brought this species to such a frequent use as might be expected. When we consider the ease with which it can be grown, and the numerous ways in which it may be used for the ornamentation of our garden, this is the more surprising. It has been used for hedges; and for a mixed border of shrubs is most useful, lightening the sombre green foliage by the floriferousness at this season. It is a good town plant.

HOME CORRESPONDENCE.

THE QUEEN'S CELEBRATION, 1897.—The suggestion of your correspondent "A. D." in Gardeners' Chronicle, p. 500, concerning an exhibition portraying the advancing stages of horticulture during Her Majesty's reign, is a happy one. And what marvel-lous changes we should see in all departments. When Her Majesty ascended there were few Roses of merit [], if we except some half-dozen or so species. a variety or two of Mosses, Provence and Damasks, that are still found in the best and most complete collections. Our best yellows at that date were Banksia lutea and Rosa lutea variety; Harrisoni, a double-flowered form of Austrian Briar. In this colour alone we have a very interesting improvement: all forms and sizes, shades of yellow and copper, in delightful variety and quantity, from the deep apricots of Safrano (1839), Mdme. Falcot (1858), and William Allen Richardson, to the magnificent size and form of Marcchal Niel. It is the same in almost every class. Might not small classes or collections he got together, each one being confined to those varieties introduced during a decade! One would see at a glauce the improvements which have been made, and a series of such classes at the Crystal Palace show of the N. R. S. would certainly attract much attention. A. P.

NEPENTHES.—These interesting and handsome plants are grown in considerable numbers at Syon House. These are chiefly concentrated by Mr. Wythes in two of the houses, the largest being suspended in the newer Emana-house, where the conditions are perfectly suited to the needs of the plants, others are in one of the three quarter-span stores over the Orchids. Of the newer species, N. mixta is grand in pitchers and colouring, so also are N. Curtisii superba and N. Mastersii. H.

MALMAISON CARNATIONS. I send you a few blooms of the variety "Princess of Wales." The plutts have been grown in the gardens of the Hon. Henry Edmand Butter, Nidd Hall, Ripley, Vorkshire, in 6-inch pots, and have produced on an average ten terminal buds. Some of the blooms have measured upwards of 63 inches in diameter, and the majority of the blooms have been over 5 inches. If D. [The blooms represent very successful culture. They are both large and fragrant. We are sorry we cannot use the photograph. Ed.]

EGYPTIAN BEET IN SCOTLAND.—A Scotsman's remarks on p. 502 of the last issue of the Gardeners' Chronicle, draws attention to the fact that "D. T. F.," on p. 378, has discovered that Egyptian Beet is never, or hardly ever, grown in Scotland. A limited acquaintance with gardeners and gardening north of the Tweed, is probably an excuse for ignorance of the value of Egyptian Beet in this northern clime. It does not pay to grow it in quantity for either public or private consumption! Edinburgh market growers know a good Bect, and one that pays them well. Egyptian has been tried, and found wanting in these essential qualities. Beta Bona.

WHITE AND YELLOW TURNIPS. — Patriotic Scots ayout the Tweed need not take "D. T. F." too seriously, and should allow him a reasonable length of time to renew his early acquaintance with Scottish horticulture. If "D. T. F." had looked into the Waverley Market about 9 o'clock last Saturday morning, he would have seen what market gardeners find most profitable for the supply of their cu-tomers, and he would have found white "Neeps" strongly in evidence. October, however, is not the season for white "Neeps" in Scotland, which is from May to September. In summer it is about as rare to see a yellow "Neep" as it is to see a white one in the winter. The Early Milan (extra early, if "D. T. F. "likes") Turnip has been grown for many years in every garden and market garden of any note north of the Tweed, and it forms the staple supply for the Edinburgh market in May and June. In private establishments, white-fleshed Turnips are in demand, and in most gardens of repute a supply of them must be maintained "all the year round." With the aid of Early Milan, it is an easy matter; but where yellow-fleshed Turnips are acceptable, they are quite as easy to grow, and

quick growing, and must be disposed of when fit or they spoil. If sown too early it runs to seed; the most enduring form of white fle-h Turnip is the Green Globe. On the other hand, the vellow or golden fleshed Turnips are all exceedingly hardy, solid in texture, almost glo bular in shape, will keep through the winter, and eat the next season as sweet as though they had just been lifted. The garden varieties of these Turnips are only refined stocks which, in the course of re-selection, have become smaller in size, more symmetrical in shape and delicate in the texture of their flesh, and constant experience of them from youth upwards leads the Scotch gardener to prefer them to the soft-hearted kinds of the south. As to the flavour of the one against the other, it is the general opinion that the white does not nearly approach the yellow. With respect to round Beet, the very name "Egyptian" is sufficient to frighten many of our northern gardeners from giving it a space, and whatever may be said in its favour on the point of earliness, there is no getting away from the fact that the "cooks" do not take to it. I asked one the other day why it was so, and her answer was, "that the colour boils out so easily, and its shape produces such

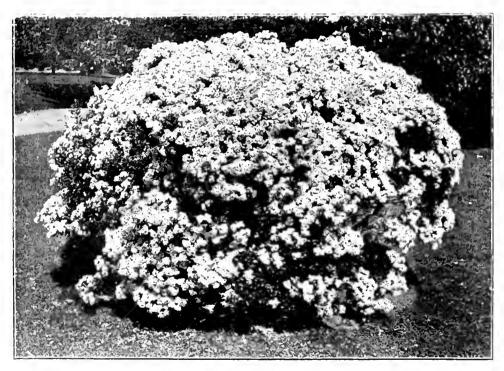

Fig. 96. -GLEARIA BAASTH: FLOWERS WHITE. (SEE P. 582.

keep much better after they are lifted and stored in the late autumn. They keep firm, erisp, and sweet from November till May when properly stored. Modern " Reckie

I have only just seen "1). T. F. s on p. 375, and with your permission should like, from my point of view, to throw a little light on the queries he raises. To go back to the early days of the Turuip, we find the white-fleshed variety brought over from Holland, and first cultivated in fields in the warm sandy soils of Norfolk: from here it ran through the country, and when tried even in the Lothians was found to be quite unsuitable to the rigours of the climate of Scotland. In name it became known as the Norfolk White Round, but White Globe is perhaps the best appellation to give it; at any rate the enlightened farmers of the North were not long before they effected a union between it and the Swede, which they then grew as their leading root crop, and the result was the stout-hearted yellow fleshed Turmp. The white Turuig is easily injured by frost, whilst in many varieties there is an indentation between the neck and the shoulder, causing the wet to lodge, and the bulb to rot when the rainfall is excessive. In rich soils it becomes monstrous in size, flabby and stringy in texture, and loses a proportionate quantity of the most nutritive elements of its composition. It is

cumbrous pieces, that, when cut up they spoil the look of a salad." Early vegetables are not a necessity look of a salad." Early vegetables are not a necessity in many of the leading establishments in Scotland, which are, to all intents and purposes, shut up until late in the summer. The Red Globe Onion is probably preferred also on account of its hardy nature; it will stand any amount of wet, and its solid coat assists it to withstaud to a great degree the ravages of vermin, and it will keep a twelvementh if well-harvested.

I was on Deeside recently late in August when I found Peas, Gooseberries, and Strawberries in full season, quite a month later than in the south. table seeds that we sow in the open in March and April they seem convenient to hold until May and June. In large places they defy the seasons, as we do in the south by sowing under protection; indeed, it is only under such conditions that many of our tender things are of service to them. D. McD.

GROS COLMAN AND GROS MAROC GRAPES .-I ought to know something about "Gros Colman" as it was always called when first introduced, and as Mr. Barron still calls it, for I was, perhaps, the first to grow it in this country. In appearance it is very fine when well-coloured, and I have grown the berries to 4; inches in circumference: but in quality it is safly lacking, pulpy, coarse, and with a very peculiar, and to most people, unpleasant flavour. As some persons like the American Grapes, they may also approve of Gros Colman. The Vine itself has a very strange and disagreeable smell sometimes, when in full vigour and high temperature. Please refer to Mr. Barron's account of this Grape and of Gros Maroc. If that great authority can err, it is on the side of It is much against my interest to speak thus of the Grape, for I have scores of the Vine, unluckily. and only a few of Gros Maroc. The slow public are beginning to find out the rogue, and I can scarcely sell it now in this neighbourhood. It requires months of hanging to become really ripe, and then unless the house is kept very dry and rather warm, an exudation through the skin takes place, and the berries rot. 'Gros Maroc,' though not quite so large, is almost as handsome, from the lovely blue bloom it carries; it ripens about two months earlier, and is really good. But, like every other fruit, it has its special drawback. The Vine is a shy bearer while young, and especially subject to red-spider. Vinitor.

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

OFFICER 13.- Propert : Dr. Bonavia (in the Chair): Dr. Russell, Rev. W. Wilks, Dr. Müller, Mr. Douglas, and Rev. G Henslow, Hon. Sec.

Vines D second. The following communication had been received since the last meeting from Mr. Messenger, Worlverstone Gardens, Ipswich: — "I enclose a bunch of Black Alicante Grapes and two leaves, one of Black Alicante, the other of Gros Colman. I am desirous of knowing the cause of the discoloration of the stem, footstalk, and berry, and why the leaves are dying at one particular place; and further, what remedy I should apply?" The following report has been received: "The follage, leafstalk, and also stake and some of the berries appear to be infested. with fungi, which I believe to be Peronospora viticola, which I have seen attack Vines in the same form as those received. The leaves first get whitish patches and then dry up, and the leafstalks are similarly affected. It would be advisable the leafstalks are similarly affected. It would be advisable to thoroughly scrub or paint the interior of the house, limewash the walls, and remove the surface of the border to eradicate any germs. It might also be advisable to see that the border is sweet and properly drained." S. T. W.

Potatos Discosol. -Samples were received from Mr. H. S. Bartlet, F R.H S., of Severnburg, Shooters Hill, characterised by having spots within them. They proved to be a form of the ordinary Potato disease, Peronospora infestans.

Monstrous Structures, Mr. C. Browne, of Hextable, Kent of the angle of th

 $Apple\ iside\ Red\ Fleih$. Mr. Henslow showed specimens of the red Apple, known as "Ten Commandments," described in Hogg's Fruit Manual, p. 22s. The name is derived from the ten red spots caused by the fibro-vascular cords passing through the Apple, the flesh of which is more or less of a crimson hue throughout. It is a Herefordshire Apple, and ecunson hue throughout. It is a Herefordshire Apple, and according to Mr. Wright (to whom it had been submitted) is more clongated than usual. It was received from Zeals (a village on the borders of Wills and Somerset), where there are two trees near each other, very old, and 9 feet in cumference at a height of 3 feet from the ground. Nothing is known of the history of these trees. The question was raised as to the form of the Apple being due to the locality raised as to the form of the Apple being due to the formity where the tree grew, is Mr. Buley has lately published a paper, showing how different kinds of Apple trees, though only grafted, often assume the same form of fruit when growing in the same States of North America respectively. Mr. Wright informed Mr. Henslow that the importance of knowing the locality in England whence an unnamed Apple was received had been already felt by himself and br. Hogg.

Expressional, earnest Solts on the Colour of the Flowers of February.—The following reports were received.—

Dr. W. F. Russell's Experiments with White Polargon Dr. W. F. Rush (i. Experiment) with White Principon chas.—
Ten white Pelargoniums were received from Messrs.
Cannell & Sous. They were all strong healthy plants. Experiments commenced on J me 20. All the plants were taken out of their Lots, the soil gently shaken off, and then reported Two of the plants were reported in ordinary good s others in soil which had been thoroughly drenched with a solu-tion of one of the following salts, all of them being of the same strength, viz., 13 grains to the pint: —Sulph ite of ir-an, sulphate of copper, nitrate of cobalt, nitrate of nickel, acetate of chromium, sulphate of manganese, nitrate of zine, and chloride of ammonium. They were kept in a conservatory, and were watered with the respective solutions, containing 6½ grains to the pint—It was found that the lime in the water used to the pint. It was found that the time in the water used was precipitated by the sulphates, and so carried down some of the metal; consequently, on June 30, the sulphate of manganese was changed for the chloride, the sulphate of iron was changed for perchloride of iron, and the sulphate of

* The Plant Induction. In the Light of Evolution Address before the Biological Society of Washington, Jan. 12, 1895.—See Journal of Hortculture, Oct. 15, 1896.

copper was dissolved in distilled water. The plants were watered to the same extent that they would have been under ordinary conditions of growth. Angust 1.—All the plants are now in flower; all the flowers are quite white, and all the plants are quite healthy. September 1. All the plants are quite healthy, and there is no visible difference between them. October 1.—All the plants are quite healthy, and still there is no visible difference between them."

Rev. W. Wills' Experiments with White Pelorgonians.—On June 24 ten plants of a white-blooming zonal Pelargonium were received. They were all treated exactly as described in Dr. Russell'sreport. After the plants were reported, they were for four days placed under the stage of a close Fern-bouse, and then trought up on to the stage of a close Fern-bouse, and then trought up on to the stage of a very light and airy green-house, where they have stood till this date, October 12. At the commencement plants 1, 3, 4, 5, 7, and 8 were somewhat stronger than 2, 6, 9, and 16; 9 and 10 being the two to which nothing was added, and which have been watered with ordinary water. Each plant has had about 20 pints of fluid. Results: The plants none of them; dagged at all from the reporting beyond being one or two of the lower leaves. All have bloomed well throughout the whole season, and are still carrying fine trusses. No. 1 lost one limb from mildew, but this was probably the result of pure accident, and should not be attributed to the special treatment. It has since made new growth which is stronger and more vigorous, and the foliage distinctly larger than any of the others. No. 2, 8 are rather stronger, and the foliage darker than the remainder. No. 7 has every leaf showing all the veins and fibres in clear pule yellow; the leaves are also somewhat small, but otherwise they are crisp and look perfectly healthy. The colour of the flowers does not appear to have been in any case or in the smallest degree affected.

Rev. W. Welks' Experiments with Apples.—Three young Cox's Orange Apple trees were chosen situated on one border, a distance of 8 yards separating each tree from the next. Tree a was dressed with 1 lb. of soot on April 1, May 1, June 1 and 15, July 1 and 15, and August 1 and 15. Tree c was, on the same dates, dressed with 2\frac{1}{2} ozs. of sulphate of aumonia. The dressing was scattered on the ground within compass of the spread of the tree's branches, and the ground was then immediately raked over somewhat hardly to stir the surface. Tree a was undersead, but similarly raked on each occasion. The fruit was gathered on September 21, and on examination on October 12 it was found that the produce of tree c was very slightly the highest coloured, no difference whatever being apparent between the produce of v and a

The general result of the action of salts used upon the white flowers was negative, but with chromium an effect was noticeable on the leaves, in that the fibro-vascular cords remained of a dark colour, the interstices being yellow-green. This was the case with Mr. Wilks' plant, and to a less extent with Mr. Henslow's. All the plants flowered well, and were perfectly healthy.

OCTOBER 27.-Judged by the very large displays we have now become accustomed to see at the fortnightly meetings in the Drill Hall, Westminster, the one held on Tuesday last was much below the average. This was in a large measure attributable to the absence of hardy flowers, which latterly have been exhibited in numerous and large collections. There was a good display of Orchids, and several awards were made. Muc'i interest attached to the exhibits of Chrysanthemums; but these were rather less nu berons than might have been expected at such a date, in view of the circumstance that a lecture upon these plants by Mr. W. H. Lees was to be read on this occasion. Several novelties of excellence were before the committee, however, and to a few of these Awards of Merit were recommended. A group of winterflowering Pelargoniums in bloom was shown from the Royal Gardens, Frogmore; and in a few instances there were collections of miscellaneous plants. The fruit display was by no means equal in extent to such exhibits at the last few meetings.

Floral Committee.

Present: W. Marshall, Esq. (Chairman), Jno. Fras. r. H. B. May, H. Herbst, R. Dean, R. Owen, G. Stevens, J. Jennings, J. Hadson, J. F. McLeod, T. Peed, R. M. Hogg, W. Bain, J. D. Pawle, Geo. Nicholson, Rev. Geo. Engleheart, J. T. Bennett-Poc, C. E. Pearson, J. Walker, J. W. Barr, H. J. Jones, C. E. Shea, H. S. Leon and C. T. Druery.

Messus, J. Phan & Sons, West Norwood, exhibited one of their characteristic groups of miscellameous store and greenhouse plants, consisting for the most part of Dracanas and Crotons, several Cypripediums, and a few plants in flower of Saintpaulia i-martha (Silver Flora Medal).

Another miscellaneous group of plants was the exhibit of Messrs, Jao. Laire & Sons, Forest Hill, London, S.E. This collection included many choice plants, including a finely-flowered specimen of Cypropedium Harrisianum, several plants of a cream coloured single flowered Begonia named Autumn Queen, Dragana australis variegata, Cephalotus tollicularis; and a few Caladiums were noticed (Silver Flora Modal).

A luge group of Cretons was shown by Earl Piner, Syon House, Brentterd (gr., Mr. Geo. Wythes), which included a considerable number of varieties in various sized plants (Silver gilt Banksian Medal).

Several seedling Nerines were exhibited by Sir Trevor Lawrence, Bt., Burford, Dorking (gr., Mr. Bain). N flexuosa major was recommended an Award of Merit. The flowers

are lilae-pink, with darker coloured veins, and very effective. A variety named Meadow Bank, almost coral searlet, and Cinnabarina, very bright in colour, were also admirable.

Another exhibit of seedling varieties of Nerines was made by H. J. Elwes, Esq., Colesbourne, Gloucester (gr., Mr. Lane). These represented various colours and shades, and were very pretty.

Mr. Anthony Waterer, Knap Hill Nursery, near Woking, exhibited plants, 6 or 8 feet high, of a scarlet leaved Oak, remarkable for keeping its brilliant leaves till mid-winter. It is apparently a form of Quercus rubra, not of coccinea; also plants of Pieca pungens glanca and P. p. argentea (Colorado Blue Spruce), to show how much superior the latter variety is to the former; also a group of seedling varieties of Pernettya in full herry (Bronze Flora Medal).

A First class Certificate was recommended to Sarracenia Sanderer, shown by Messrs, F. Sander & Co., St. Albans. This is a most elegant plant, towards the apex of the pitchers they are mottled with white, and the veining is of

deep rich purple.

From Her Madesty's gardens at Frogmore Mr. O. Thomas exhibited a large group of zonal Pelargoniums in flower. There were numerons varieties, both single and double-flowering, and the group was one of the brightest exhibits in the hall (Silver Banksian Medal).

theysowhemans—A. Pears, Esq., Green Bank, Isleworth (gr., Mr. W. Farr), exhibited a very commendable group of chrysanthemans, in some instances the varieties being represented in excellent condition. The Chrysanthemans were not interspersed with any relief plants, but the group was fixed with a few Palms and Adiantum Ferns (Silver Flora Medul).

Another group of Chrysanthemums was staged by Mr. W. Wells, Earlswood Nurseries, Redbill, Surrey. Most of the plants were in 5 or 6-inch pots, and carried one bloom only. Many of them were of the variety Australian Gold (Calvat), a capital Japanese variety of deep golden colour when the second crown or terminal hads are taken. As the blossom develops, the florets open in a twisted or whorled manner Award of Merit).

A similar award was granted to the variety Mrs. J. Lewis, a handsome white flower of the Japanese type; the florets are wide and pure white, excepting a slight tinge of pale lemon. This was well shown in Mr. Wells' group, also some plants of the variety Jno. Sbrimpton. Mons. Chenon de Leche, a handsome Japanese reflexed variety, of rose and buff, also from Calvat, and figured in the Garden es' Chemiete, Dec. 7, 1815, p. 683, was included in the group. The florets, although reflexed, assume a recurved position at the extremities, where they become spoon or scoop-shaped. Mr. Wells also showed a crimson star-shaped decorative variety named

Trafalgar. The group was awarded a Silver Banksian Medal, Mr. Wells exhibited cut blooms of Hurry Johnson, light chestnut, incurved; Mons. E. Rosette, a long petilled white Japanese; Lord Justice Lopes, pale lilac-coloured Japanese; and Mrs. D. Dewar, a white Japanese.

Among the ent blooms of Chrysanthemums two dozen from Mr. W. J. Godfrey, Exmouth Nurseries, Devon, were conspicious. In this stand there were half-a-dozen excellent blooms of the variety Australian Gold, already noticed in the group from Mr. Wells; but Mr. Godfrey's blooms were of much deeper and more natural colour (Award of Merit). Mr. Godfrey also obtained an Award for the variety Pride of Exmouth, a large Japanese flower with white florets tinted with like, the centre being straw-coloured. Other good varieties in this collection were Belle Manye, Emily Silsbury, La Garonne, Mons. Hoste, and Antoinette.

Messis II. Cannell & Sons, Swanley, Kent, exhibited two very fine blooms of the variety Mrs. J. M. Lewis, pure white, Japanese, large and very deep Award of Merit. Among others of Messis. Cannell's flowers were Mrs. Opento Tait, a broad-floreted fancy Japanese with twisted flor ts, rich gold colour (Award of Merit); Ernest Cannell, an incurved flower of promising character; A. H. Wood, a yellow sport from Primose League, and Pride of Exmouth.

From Mr. Robert Owen, Castle Hill Nurseries, Maiden-

From Mr. Robert Owen, Castle Hill Nurseries, Maidenhead, was shown incurved variety, Mr. Jas. Murray, rosylide, inclined to bronzy tint in centre of flower (Award of Merit), and Prefet Cassagneau, a crimson decorative variety.

Mr. A. H. Rickwood, gr. to the Dowager Lady Freake, Fulwell Park, Twickenham, exhibited a dozen blooms of a singular variety, named Fulwell Park. The thorets were pale like, curiously striped longitudinally with yellow. An Award of Merit was recommended to Japanese Chrys-

An Award of Merit was recommended to Japonese Chrysanthenum Elsic Teichmann, exhibited by C. E. Shea, Esq., Foot's Cray, Kent. This is an undoubtedly fine acquisition; the florets are exceedingly broad, and they are of good length also. They appear to reflex, but are incurved at the tips. The flowers are very large, white, with slight lennon in the centre. It is a seedling raised by Mr. Shea, and a plant with four blooms upon it was shown.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair, and Messes, J. O'Irien (Hon. Sec.), J. Gurney Fowler, De B. Cravshay, H. M. Pollett, H. Ballantine, J. Gabriel, H. Williams, H. J. Chapman, J. Jaques, E. Hill, W. Cobb, A. H. Smee, J. Donglas, T. W. Bond, Sydney Courtaild, and Dr. Maxwell T. Masters, F.R.S.

A gold medd was awarded Messrs, J. Villen & Sons, Royal Exotic Nursery, King's Road, Chelsea, for a remarkably fine group which would be praiseworthy at any season of the year. Among the plants of hybrids staged specially a markable were the new Cartleya - Elvina (Frimae 7, Schilleriana 3), a dwaif plant bearing large flowers, the sepals and

petals of which were of that light purple rendered familiar in Laclio-Cattleya × elegans Turneri, the petals having a narrow silvery margin. The distinctly three-lobed lip had a broadly-reniform front-lobe, of a bright light purple tint furnished with veins of a darker tint; the side lobes, which fold over the column, have their tips singularly erect like the ears of some kinds of animals, and coloured like the front lobe. The middle area was of a yellow colour and streaked with reddish brown (Award of Merit); Cypripedium × Reginæ (× Leanum 9, Fairicanum 3), a very pretty hybrid, suggestive in its general features of C. × Arthuramum, but with the upper two-thirds of the dorsal sepal pure white, and decorated with a few lines of a purple tint (Award of Merit); and Cattleya > Patrocini (syn. hybrida) (guttata var. × Loddigesii). In the centre of the group stool fine varieties of Cattleya labiata, and at intervals there were placed panfuls of Cypripedium × cenanthum superbum, C. Spicerianum, C. × Lecanum sup rbum, C.× Arthurianum, C. insigne montanum, C. purpuratum, C. × tesselatum perphyreum, C. × Chas. Canham, and others. Arranged with them were Dendr-Dium Phalauopsis Schroderianum, Cattleya× Chloris, Ladio-Cattleya & Statteriana, L.-C. × Nysa, Lycaste costata, L. lanipos, &c.

The next largest group was that staged by Mr. H. J. Chapman, gr. to R. I. Measures, Esq., of Camberwell, and the specinens in it included both showy and botanically interesting species. The remarkable and pretty Cattleya labiata "R. I. Me sumes" was a centre of attraction, its fine snow-white flowers, with a distinctly defined pure pink veining on the front of the lip, removing it from the repreach often accorded albinos, with faint colouring (First-class Certificate). In the centre of the group was a large specimen of Ceologyne fulliginesa, covered with its fringed, sooty-lipped flowers; and in the group were fine specimens of Cypripedium × Mrs. Chas. Cambam (sixteen flowers), C. × Hy. Graves 'Lawrenceanum × Marshalliamum); a noble C. tonsum, C. × Allenianum superbum (Spicerianum × Curtisii); C. Schomburgkianum, C. × Milo; a few varieties of C. insigne, for which the collection is noted; two forms of Ladio-Cattleya × Schilleriana; some handsome Cattleya labiata, that named "superba" having a lunge and richly-coloured lip; Masdevallia Laucheana, M. × Measuresima, M. × glaphyrantha; the singular Angreeum candatum, Restrepia Falkenbergi (Botanical Certificate), and R. antennifera (Botanical Certificate). A Silver Flora Me 'al.

The honour of taking one of the two First-class Certificates awarded on this occasion fell to Messrs. Linden, Park Leopold, Brussels, for the very remarkable natural hybrid Cattleya - Lec'zar (supposed to be a cross, C. labiata×C. granulosa). Its nearest affinity seemed to be Cattleya × Victoria Regina (illustrated in the Gordon es' Chronicle, June 25, 1892, p. 808), but in this the flowers are larger, the petals broader, and the isthmus of the lip so much longer as to give some indications of the influence of C. granulosa. It is certainly a grand Cattleya. The sepals were light like with a greenish tinge; the broad petals light like-rose with fine purple veining. The side lobes of the lip, which were folded over the column, were blush-white; the creeted tips purple. The distinct isthmus connecting the posterior with the anterior portion of the lip was dark red with rich orange markings, and the broad front lobe bright crimson-purple with a delicate lawendar margin.

Thos. Statter, Esq., Stand Hall, Whitefield, Manchester, was awarded a Silver Flora Medal for a very pretty stand, composed principally of cut spikes of numerous varieties of Dendrobium Phalænopsis Schroderianum, and Cattleya aurea, among the latter being C. Dowiana aurea Johnsoni, in which the purple colour was almost suppressed in the fine goldenveined lip. With them were the handsome Ledio-Cattleya × Arnoldiana superba; L. C. > Stanleyensis (L. Dayana × C. aurea)? L. C. & Ingrami; Cypripedium × Calloso-Fairieanum C. & Memoria Moensii, &c.

F. Hardy, Esq., Tyntesfield, Ashton on-Mersey (gr., Mr. T. Stafford), showed a splendid plant of the true Cattleya labiata autunnalis alba with three flowers on a spike; C.×Hardyana, Wrigley's var.; the pure white Pleione maculata alba; Cittleya × Massaiana, and several plants of Lælia pumila.

M Georges Mantin, Château de Bel Air, Olivet, France, showe i a group of the handsome Cattleya × Mantinii (Bowringiana × Dowiana), of which the beautiful C. × Mantini nobilior was by far the best, and for it a Cultural Commendation was awarded. There were in M. Mantin's group Ledio-Cattleya × Belairensis (C. Lowringian) ?, L. autumalis \$\delta\$), a most extraordinary hybrid which will doubtless greatly improve; Ledio-Cattleya × Behrensiana and L.-C. × B. inversa and Cypripedium × Boneardii (superbiens ?, barbatum \$\delta\$). A Silver Banksan Medal was awarded the exhibitor.

II. J. Elwes, Esq., Colesborne, Andoversford, exhibited a very interesting group, in the centre of which were a nice plant of Arandina chinensis, Ilabenaria Suzanne, and the singular looking II. decipiens. Around them were Dendrobium Aphrolite, Saccol diam bigibban, Acampe papillosa, Pleione Wallichiana, P. lagenaria, Dendrobium macrostachyum, Liparis species, and a very curious Cirrhopetalum with long, solitary flower, with purple fringe to the upper sepal and petals (Bronze Banksian Medal).

A Cultural Commendation was given to Mis D. SMITH, King's Ride, Ascot (gr., Mr. W. Lane), for a grand specimen of Cattleya Bowringiana.

Messrs, F. Sander & Co., St. Albans, staged a group in which were Phaius Ashworthianus (Mamm - maculatus), with yello v flowers and yellow-spotted leaves; Angaceum Humblotn, Cattleya - Johnsonana superba, Dendrobian Johnsonac, D Phalenopsis Schroberianum, D. Stutterianum, Oncidium tigrinum, O. varicosum, many fine forms of

Cattleya labiata, among which were C. l. The Bride, a white variety with Hlae lip, and C. l. The Pearl, also a nearly white

Messrs. B. S. Williams & Son, Victoria and Paradise Nursories, Upper Holloway, had a group rich in forms of Cattleya labiata, of which C. labiata versicolor was a specially remarkable form. Also were included good ex umples of Cypripedium × Arthurianum, C. insigne Wallacei, C. i. punctatum violaceum, C. × Pitcherianum, Williams' var., Oncidium ornithorhynchum album, O. Forbesti, &c.

Messrs. Hugh Low & Co., Clapton, had a pretty group, in the centre of which was a splendid example of the Swan Orchid (Cycnoches chlorechilon), also very fice varieties of Cattleya labiata, and a splendid form of Cypripedium × Memoria Moensii. In the group also were Oncidium ornithorhynchum album, some good Odontoglossum grande, Cattleya aurea, Cypripedium × Arthurianum, and other Cypripediums: Masdevallia muscosa, Bulbophyllum Dearei, Dendrobium enfieldiense, a remarkable flower, resembling D. Leeanum, but with a longer and narrower lip.

H. Shaw, Esq., Heathfield, Birch Vale, Derbyshire 'gr., Mr. J. Cliffe), sent Cattleya maxima Heathfield variety. C. L. N. Ingram, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), sent Lælio-Cattleya × callistoglossa Ingravii, very rich in colour, and L.-C. × Gazelle splendens (L. × elegans × C. tricolor).

Sir WM. Marriort, The Down House, Blandford (gr., Mr. Thos. Denny), sent Cattleya × La Belle (Warscewiezii × Harrisonie), a very large light rose flower, with purple front to the lip; and Cypripedium × Marriottianum (Spicerianum × niveum).

to the lip; and Cypripedium × Marriothanum (Spicerianum × niveum).

Walter C. Clark, Esq., Sefton Park, Liverpool, showed Cypripedium × (Argus Moensil × vexillarium), a very handsome hybrid with the rich dark spotting of C. Argus. S. G. Latwyche, Esq., Beckenham (gr., Mr. Paterson), showed some good Cypripedium, &c. Messrs. John Laing & Son, Forest Hill, had a good group of showy Orchids and other plants.

Fruit Committee.

Present: H. Bulderson, Esq. (Chairman), and Messrs. Henry G. Pearson, Jas. H. Veitch, Jos. Cheal, A. F. Barron, J. Wright, Alex. Dean, C. Herrin, J. W. Batos, Geo. Woodward, F. Q. Lane, Jas. Smith, J. Willard, Robt. Fife, Geo. Wythes, and W. Farr.

The objects brought before the committee were few and of no great interest, Mr. Crasp, gr. to F. L. S. Foljambe, Esq., Osberton, Notts, showed a collection of Melons (twenty-four), apparently Hero of Lockinge, well netted, and also weighty fruits for their size; a Silver Bunksian Medal was awarded. He also showed a piece of stem of Vanilla aromatics with pods upon it. Mr. Crasp showed nice-looking bunches of Golden Queen Grape, a thick skinned variety, with, as Mr. Barron says, "a squashy pulp," and not much flavour. The fruit had an excellent appearance, and it keeps well when well ripened. A Cultural Commendation was accorded. Several Melons from various exhibitors were shown, but no award was made. Seedling Apples were likewise shown with a like result.

A seedling Grape was shown by Mr. C. Stubbington, Brookside, Cambridge. A red Cabbage of Drumhead form, and named Black Short-stem, was also shown, together with two poor varieties of Celery, one being called the self-blanching, the other was like the Plume variety, but unlike that, it was furnished with a small tuberons root like Celeriac.

In the good-flavour competition, Mr. G. Woodward, gr., Barham Court, was 1st in Pears with Doyenné du Comice, gethered from a tree en the Quince, growing against a west wall; and Mr. G. Wythes, gr., Sion House, was and with the same variety.

same variety.

In Apples, Mr. Woodward was 1st with Cox's Orange
Pippin, large, high-coloured fruits, from a bush worked on
the Paradise stock; and Mr. C. Herrin, gr., Dropmore, was
2nd with Ribston Pippin, high-coloured, nice samples.

Lecture on Chrysanthemums.

The lecture read at the above meeting was one by Mr. W. H. Lexs, of Trent Park Gardens, Barnet, the subject being Chrysanthemums. It was read by Mr. Weathers, assistsceretary, and the chair was taken by C. E. Shea, Esq., who, in a few introductory remarks, referred to the exceptional success that had attended the efforts of Mr. Lees as an exhibitor.

At the commencement of the paper, which referred untilly to the culture of plants for the production of specimen blooms, Mr. Lees remarked upon the great advance that had been made in regard to the flower since 1830, when the Chrysanthemum Conference was held by the Royal Horticultural Society. The best Japanese flower of that year was not included in the first 100 Japanese varieties in the audit made by Mr. Shealast season, and in the first 188 varieties there were only three which were known prior to 1890. In the raising of varieties the Continent, especially France, had taken the lead, and the first raiser in France was M. E. Calvat, the raisor of Madame Carnot, Australian Gold, and others. Lust season more varieties were raised in England than heretofore, and despite an unfavourable climate, it appeared that we should rival France in this work.

The Chinese or incurved section was probably a little on the wane, owing, the lecturer thought, to frequent illsuccess in the culture of the plants, which most often was the result of "taking" too early a bud, or of growing the plants too strongly, in which case the buds opened indifferently. Single-flowered varieties were deservedly more popular recently, and next to Japanese, they were the most useful for purposes of decoration. The old reflexed type, such as Christine, was being driven out by the various types of Japanese. Anemone-flowered kinds were pretty, and worthy of retention. The recent additions to the early border varieties were improved in habit, and in the colours of the flowers.

Novelties in most sections, indeed, were so numerous from year te year, that the question a grower had to decide who wished to keep up to date, and to limit his collection to reasonable proportions, was, "What not to grow." Greater discrimination was urged upon the National Chrysanthenium Society in the matter of granting First-class Certificates, and none but those that possessed undoubted superiority over existing varieties should be so distinguished. Last season there were thirty-six such certificates awarded.

Propagation should be commenced about the beginning of December, and it was important that a selection should be made of strong, sturdy cuttings. They should be planted in light sandy soil, and placed near to the roof-glass in a temperature between 40° and 50°. In a month or six weeks roots will have formed, and they will require to be potted singly in 3½-inch pots, using a compost of equal parts of loam, leaf-soil, and coarse saud. They should then be placed on a shelf in a cool greenhouse, and both a close atmosphere and drought should be avoided. From this stage the object would be to induce sturdy, robust, and uninterrupted growth. They must be kept secure from frost, but not subjected to much warmth. When the balls have become slightly matted with roots, the plants will require to be moved into larger pots, using a compost of two-thirds loam and one-third leaf-soil, and decayed horse manure, with sufficient sand to ensure porosity. The potting should be done firmly, especially if the loam be light in texture; and if the soil is moderately moist when used, no water should be given for a couple of days or so after the operation.

Stopping the shoots is practised from April conwards,

stopping the shoots is practised from April chiwards, at suitable dates, for the fixing of the flowering season in certain varieties that under natural conditions produced buds at undesirable dates. Many sorts required individual treatment. Usually, the crown bud, in order to produce a fine flower, should be formed between August 10 and August 25. Incurved varieties of the Queen of England type, if grown naturally, were apt to show the first bud too early. Some varieties become very course if the bud be formed early in the month of August, as for instance, Etoile de Lyon if the bird shows before Ang. 12. The flower of the same variety, upon a bird appearing on Ang. 25, would be of a better colour, and much more perfect. About the middle of May the plants should be ready for the final potting, and the soil used on this occasion should contain more manure. It may consist of good and heavy loam, three parts, leaf-soil, horse man-nure, and a small quantity of broken bones, in addition to a portion of wood ashes to keep the whole sweet and porous. It is best not to use soot in the soil, but as a liquid solution later on. For most of the varieties, pots 10 inches in diameter are best suited. Make the soil evenly firm throughout, and place the ball of the plant in such a position in the pot that it will be covered with half - an - inch of new material. Leave 11 inch space at the surface for receiving water, and a slight top-dressiog. The plants may afterwards be placed in rows 5 feet apart, and the plants 2 feet asunder from each other in the rows, where they will remain during the summer. Syringing may be done with advantage after bright days until the middle of August, when it will be less necessary on account of the heavier dews at night. Feeding should be commenced about the third week in July, using a weak solution of cow-manure and soot on every using a weak solution of cow-in turre and soot on every third day. The kind of manure should be changed eich week. If any of the excellent artificial manures be applied, they should be given frequently but weak. Sulphate of ammonia was rarely necessary, ex-cept perhaps to stimulate some backward variety or plant. Moderate feeding should be practised until the flowers are half expanded. Some varieties need little, but Bouled Or would come nearly single if not treated liberally, and has to be built up with abundant feeding. On the other hand, Avalanche forms its bud early in August, and becomes very coarse if over-fed. Incurved varieties generally require less manure than Japanese sorts, but when the florets have commenced to open, they may be given liquid manure at each time of watering. The plants of all kinds may be much benefited by a slight top dressing with a rich compost early in August, which will encourage the formation of new roots. Immediately the plants are housed, they should be given abundant air for about a week. When the flowers begin to open, a little warmth in the hot-water apparatus may be required to keep a buoyant atmosphere. The best temperature to keep at this time is 53'. Give a little top temperature to keep at this time is 33. Give a little top ventilation during the nights when the weather renders such possible. The plants will now need less water at the root, the blooms should be shaded from bright sun, and when they are half developed the slight shading may be made permanent.

Insects.—A few remarks were then made upon the insects which are troublesome to Chrysanthemums, and Thrips were said to be the worst of all. Concealed in the young growing points of shoots they inflicted injury before it became noticed. Tobacco-powder should be dusted into the points regularly, or (they might be charged frequently with an insecticide during the whole season until taken maide.

Diseases.—Under this name the damping of the blossoms was described, and declared to be due to over-feeding, in conjunction with much restricted growth. Rarely does it occur in the case of bush plants or those grown for decorative purposes. When it has asserted itself, it is most difficult of

cure, and Mr. Lees has tried rubbing off some of the feeding-roots, and he has half-broken the stem through. If the stem at such a time be cut, it will be found to be hollow, and the pith discoloured. Colonel Smith and Eda Prass are varieties exceptionally subject to this undady. All varieties so liable should be given less manure. A few words upon mildew and spot on the leaves completed the lecture.

DEVON AND EXETER GARDENERS' ASSOCIATION.

October 21.—The subject down for discussion at the last meeting of this association, held on the above date, was "Violas for Bedding Purposes, with special reference to their adaptability for association with other Plants." The paper was written by Mr. J. W. Moorman, superintendent of Victoria Park, London (at one time in the gardens at Poltimore Park, near Exeter, who dealt with the subject in an able manner. The varieties of Violas, Mr. Moorman said, indigenous to the British Islas, were only six in number, V. Intea being the parent of the present race of bedding Violas, while V. tricolor may be said to be the parent of the Pansies of to-day. Though the Viola is a great favourite in the cooler climate of North Britain, such gardens as Trentham, Cliveden, and Belvoir have shown that it can be grown to perfection in the south. Claiming for the Viola undeniable beauty, fragrance, brightness, and diversity of colony, it was also an accommodating and a honely plant, growing as happily under the care of the amateur as under the experience and skill of the professional gardener. To be successful in their cultivation, four grand principles must be observed, namely:—(1) Obtain the best and freest-blooming sorts (not necessarily the newest ones); (2) A good, rich, deeply-dag soil; (3) Always plant out young stock raised by annual propagation; (4) Never plant Violas on ground lately occupied by Violas or Pansies alone, unless a good quantity of fresh soil be added to the staple; but it is better to plant in new quarters altogether. As to varieties, the following are good and reliable:—Whites: Countess of Hopetonia and Countess of Wharnchiffe; creamy-white: Sylvia and Lemon Queen; Primose or Sulphur: Ardwell Gem and Luceda; deep yellow: Bullion and Lord Eleho; dark-blue or violet: Archie Grant, Max Kolb, True Blue, and Holyrood; Lavender: Rosea Pallida and Duchess of Sutherland; purple: J. B. Riding and Dorothy Tennant; rose: William Niel and Rose queen; edged or bordered varieties: Goldunder, Duchess of Fife, and Border

Excepting the protection of a cold frame in severe frost, and shading from a burning sun, no artificial protection is required for autumn-struck cuttings. For an early summer display, cuttings should be taken towards the end of July or early in Angust, and when rooted they should be placed in their permanent quarters before winter sets in. In less-favoured counties than Devon, that might not be possible; and in that case, they must be given protection during winter, and planted out in early spring. The best cuttings are those springing from near the base or crown of the plant. For effect in single rows the plants should be 9 inches apart; double rows should be a foot apart from plant to plant, and the plants should dovetail towards each other. Abundance of water should be given in dry weather. In combination with other subjects, yellow Marguerites, blue Cornilowers, and white Violas go well together. Duchess of Sutherland Viola and silver variegated Pelargoniums harmonise well, and so do William Niel, Queen of Queens, and bronzed-leaved Pelargoniums. Tuberous rooted Begonias, dotted with Violas, and edged with Iresine Lindeni, combine prettily. Abutilons and Fnehsias, carpeted with Violas, have a pleasing effect. Pink Try-leaved Pelargoniums, interspersed with Violas, and edged with Iresine or Centaurea, are very effective; and so are many more similar combinations.

To illustrate the paper, many leading types of Violas, contributed by Mr. Henev Cannell, of Swanley, and others, were exhibited, and plates from the Floricultural Cabinet, showing the earlier forms of Viola

Mr. Hope showed a mounted specimen of Viola lutea, gathered by him near Ben Lomond in 1881, V. lutea being referred to in the paper read as the parent of all modern varieties.

Mr. Moorman not being able to be present, Mr. Wm. Andrews, gr. to W. Danka. Esq., reed the paper for him. An excellent discussion, and a hearty vote of thanks to Mr. Moorman followed.

WATFORD CHRYSANTHEMUM.

October 27.—The eleventh annual show of this society was held at the Clarendon Hall, Witford, on the above dites. Owing to the show being held earlier than in former years, so as to avoid elashing with the Nittlend Society's exhibition, the entries for cut blooms did not come up to the usual standard, but notwithstanding this defect, the meeting was a very successful one.

In the open class for groups of miscellaneous plants, Mr W. K. o'Arcv (gr., Mr. Tidy), come out winner of the 1st prize, Lord Ester (gr., Mr. Brown) being 2nd; whilst for Chrysanthemum group on 50 feet space the indealigable secretary, Mr. C. R. HUMBER (gr., Mr. Humer), took premier honours. This gentleman, with the same group,

obtained the Silver Cup, value 5 gaineas, for the best group in the show, and also received the National Chrysanthenium Society's Bronze Medal for best Chrysantheniums.

The awards in the members' class for Chrysanthenaum proups were won by Mr. H. J. JOURDAIN, C.M. G. (gr., Mr. Wilson); and Lord ESSEN (gr., Mr. Deane). The former also tack a Silver Cure heater graph in this class.

took a Silver Cup for best group in this class. In division 3, for members not employing more than three gardeners, Mr. C. G. Morti and Mr. A. J. Journaux, C.M.G., took 1st and 2nd respectively; and the prize to members who only employed one gardener, went to the Rev. A. Wilson, Paris. Some very fine miscellaneous groups were shown by Lord Clarenon and Mrs. Mook. Lord Aldenshum (gr., E. Beckett) was one of the most successful competitors in the show. He obtained 1st prize for twenty-four incurved varieties of cut bloom in the open classes, and also for twenty-four Japanese varieties in the same division. He also carried off the prize for the best Japanese bloom in the show, with a fine Oceana, as well as 1st honours for six incurved blooms. In the latter division Major Collis Brown (gr., Mr. Ashdown) came 2nd; Mr. T. F. Blyckwell (gr., Mr. Dinshore) taking a similar award for twenty-four Japanese varieties, and also 1st for twelve incurved varieties. In this class, Mr. V. M. Martin (gr., Mr. Wooster) won 2nd place, as well as 2nd for twelve Japanese; whilst Hon. A. H. Hibbert (gr., Mr. Cox) was leader. A like prize fell to him for six Japanese (open class), and the Rev. Burchell Herne (gr., Mr. Fowler) obtained 1st for six white Japanese blooms. The best incurved bloom was won by Mr. R. T. Prowse (gr., Mr. Bottom) with a Madane Darrier. The members' prizes for blooms were secured chiefly by Mr. T. F. Blyckwell, Mr. H. Burchell Herne, Mr. W. F. D Schreiber, Rev. H. F. H. Burchell Herne, Mr. C. G. Mott, and Mr. F. Tandon.

Messis, Serivener & Co., as on the last occasion, carried everything before them in the shape of 1st prizes for bonquets, wreaths and crosses, with an assortment superbly arranged for effect, the bonquet of Orchids being specially commented upon by the judges. Mr. II. Newman took 2nd prize for wreaths and crosses. The special trophy for bonquets of Chrysanthemans was divided between Messis. Schuyerer and Miss Forex.

Lord Alderham was 1st for collection of vegetables (open), Mr. R. Henty (gr., Brown) gaining No. 2 prize. Like awards were secured by Mr. T. F. Halsey, M.P. (gr., Folkes) and Lord Alderham; whilst Mr. Henty won special award offered by Messes, Carter & Co. for vegetables grown from their seed, with Mr. T. F. Halsey and Lord Alderham following him. Other winners for vegetables were Mr. A. Rowlinds and Reys, F. H. Hodoson and H. F. B. Dergehell, Herney. The premier honours for Apples were carried off by Lord Alderham, Mr. A. Rowlinds, Dowager Duchess of Bedeford, Mr. W. F. D. Schelder, Mr. D. Hill, and Mr. R. T. Prowse.

The members prizes for twelve table Primulas fell to the lot of Lord Athennian (gr., E. Beckett), and Lord Esher (gr., Brown), whilst similar homours were awarded to Mr. W. F. D. Schrieber (gr., Davis., S. T. Holland (gr., Richardson), and Rev. H. F. H. Berchell Henri (gr., Fowler). For six Cyclamen pots, Lord Aldenian turned out 1st, with F. May (gr., Burriss) 2nd.

For Pears, Lord Aldenham, Mr. Moon, Mt. J. D. Thomas, Mrs. Humbert, Mr. Rowlands, and Mr. G. Doult were announced leading prizetakers. The awards for the best collection of fruit were obtained by Lord Aldenham and Mr. J. F. Hulsly.

In the division open for ladies only, Miss K. Mead received last frisingle stind of ent flowers and foliage, with Miss Bleigrave, 2nd. Miss M. D. Smith was successful in carrying off last for six buttonhole bouquets (gents), and also three sprays of flowers (ladies); whilst Miss E. J. Belgrave was adjudged 2nd in both classes. Miss K. Mead, Mrs. Brinkman, and Miss J. H. Sugriffwer the winners of the awards for buttonhole bouquets of Violets.

THE BANFFSHIRE FIELD CLUB. Annual Meeting.

O. 104an 25.—The annual meeting of the members of this club was held in the Town and County Club, Banft, on the above date. There was a good attendance, and Rev Mr. Anderson. Whitchills, the president, occupied the chain.

The president proceeded to give his annual address. At the commencement, he reviewed the work of the society done during the past year. In this connection he remarked first on the able papers contributed during the year by Mr. Buie, Portsoy, Dr Alexander Brown, and Mr. William Cramond, Lb.D. He then gave an address on "Meteorology with regard to the Soil and Plant Life." In the course of a long and exhaustive paper, Mr. Anderson referred to the meteorological observations which have been taken at Gordon Castle (the Duke o) Richmond and Gordon's Scottish seat) since the 1-st century, as one of the most valuable and long continued that they had. Mr. Anderson, in conclusion, favoured the club with statistics, compiled by hims H, concerning the accumulated temperatures in the "growing" six months (April to September), with regard to the rainfull, growth, &c., which were much appreciated

TRADE NOTICE.—MR. C. HICKS has left Messrs. Shuttleworth, Ltd., and Mr. C. R. Shilling has been appointed Managing Director.

PLANT NOTE.

NERINE & O'BRIENII (PUDICA & PLANTII).

This is one of the most variable in colour of any of the hybrid Nerines, the different specimens varying in colour from light carmine to light red, pale lilae, and in some of the forms to as nearly blue as Nerines have ever yet come. The flowers of all the forms have a glistening crystalline appearance when seen in clear light. The nearly blue-coloured variety bearing a fine head of bloom is sent by Sir Charles W. Strickland, Bart., Hildenley, Matton, Yorkshire, who also sends Nerine × Novelty, a deep pink-coloured variety, which is very attractive and free-flowering.

With regard to Nerine × O'Brienii, it should be said that varieties of this hybrid by some mischance have get into gardens, and even into the collection at Kew Gardens, under the names N. humilis carminata, N. humilis elegans, N. humilis corrules or corrulescens, &c. The specific name humilis, of course, does not apply, for the plant is a hybrid as indicated above. J. O'B.

LAW NOTES.

EXTRAORDINARY ORCHID DISPUTE.

In the City of London Court on Monday, before Mr. Commissioner Kerr, the case of Rappart r. Peat and Dillon was tried, raising a question of importance to Orchid growers and others. The plaintiff, Mr. David B. Rappart, The Promenade, Liscard, Cheshire, sought to recover against the defendants, Mr. W. B. Peat and Mr. Malcolm Dillon, excentors of the late Mr. G. D. Owen, 24, Grosvenor Road, Newcastle-on-Tyne, the return of the sum of £17–6x. 6d., which lead paid to them for certain Orchids.

Mr. Piesse, plaintiff's counsel, said that plaintiff attended the sale of the Selwood collection of Orchids which was held at Selwood, Rotherham, Yorks, on April 24, 25, and 26, 1895, when the late Mr. Owen's collection was disposed of by auction, Messrs. Protheroe & Morris being the auctioneers. The plaintiff's case, shortly, was that he there purchased Orchids which were not of the rarity represented, and he consequently asked for his money to be returned. There was no question of feeling in these proceedings, the plaintiff considering only that a mistake had been made.

The plaintiff was called, and said he purchased au Odontoglossum elegans, four bulbs, with one growth, for five guineas. He also bought for eight-and-a-half guineas a Dendrobium splendidissimum grandiflorum, and a Cattleya Skinneri alha, with seven bulbs, for which latter he paid eight-and-a-half guineas. At the time he bought the plants they were not in flower, and it was impossible to tell what varieties they were other than from the descriptions contained in the catalogue, on the faith of which he purchased. In April, when the Odontoglossum flowered, he found that it was O. Halli, and was worth, instead of five guineas, about 2s. 6d. The Dendrohium turned out to be D. Ainsworthii, and was worth about 2s. or 3s. The Cattleya Skinneri alba turned ont to be quite an ordinary variety, and not an alba at all. The petals were of a light rose colour. In cross-examination he said he could not say he had a very great knowledge of Orchids. He had only been collecting them during the past eighteen months. He had about 1,000.

Mr. Commissioner Kerr (surprised) : What do you do with them all $\tilde{\ell}$

The Plaintiff: It is a hobby.

Mr. Commissioner Kerr: Oh!

The plaintiff further said that he was quite sure the plants had not got mixed up while in his houses. He produced the plants in court for the inspection of the learned judge.

Mr. Commissioner Kerr: I hope the legal atmosphere will not kill them or even damage them.

The plaintiff in further evidence said that the Den drobium came from the Quorn House collection where Mr. Owen purchased it. After he had bought it from the defendants, Mr. Protheroe, who was staying

at the same hotel as he did, told him that he was afraid it was not the true variety. At the sale the plant was exhibited.

Mr. Edwin Pollock, defendants' counsel, said they were quite satisfied that the plants which they sold to the plaintiff were true to their names, and that the plaintiff had mixed them up in some way or other.

The plaintiff said that he did not complain of any error of description. What he said was, that he had not got the plants which he bought.

Mr. Commissioner Kerr said there was no suggestion of mala fides. He thought the matter might be referred to some one who could act with impartiality, and in whom the parties had confidence.

Mr. J. Baggallay, the representative of Messrs. Charlesworth, Bradford, Orchid growers and importers, said that in April he happened to call on the plaintiff on business, when he saw the Odontoglossum. It was certainly not an elegans, but a very poor variety [of Halli].

Mr. James McNab, traveller for Messrs. Sander & Co., St. Albans, said he also called and saw the Cattleya Skinneri alba, and it was not an alba at all. The petals were slightly flushed with rose. His firm sold the plant (which was supposed to have been bought by tho plaintiff) to Mr. Owen, and they paid thirty-five guineas for it. That could not have been the one now in quostion. They also sold Mr. Owen for fifteen guineas the Odontoglossum elegans. They were then both in flower, and there was no mistaking them for the plants now produced.

Mr. James O'Brien, Ilon. Sec. of the Orchid Committee of the Royal Horticultural Society, gave evidence in support of the plaintiff's case.

For the defendants, evidence · as given to show that the defendants had, in fact, sold genuine plants to the plaintiff.

Mr. Commissioner Kerr said the case was a very difficult one to decide. He would take time to consider his decision.

FRANCE.

NANCY.

I will to-day give you some notes taken at the establishment of MM. V. Lemoine et Fils, Nancy, which may interest your readers. To begin with, I was attracted by a collection of Delphiniums, almost all raised by the firm. All colours, from pale manve to purplish-violet; indigo, navy and turquoise-blue are there; and all forms, from semi-double flowers, bilaterally symmetrical, with variously-coloured markings, to those with an open and spreading cup quite imbricated. Among the old varieties we noticed the following, which, for their beauty, should be in all collections: Ranunculiflorum, cobalt-indigo; Louis Thibaut, analogous in form, bronze-lilac; Watteau, clear-lilae; Monument, very large semi-double flowers, clear navy-blue; Etoile du Nord, Prussianblue; Froufrou, large pale-blue pompons. Among newer varieties are :- Jules Sandeau, torquoise; Michelet, indigo; Emeraude, clear-blue; Sceptre d'Azur, very large cobalt flowers; Sirius, ultramarine; Aziyadé, sky-blue; Falguière, sky and rosy-white; Dumaine, torquoise and white; Roumanille, dark violet; José Maria de Heredia, porcelain-blue; and other forms. There were also some seedlings, distinguished only by numbers, and not in sufficient quantity to be put in commerce for some

Among the finest varieties of Potentilla here seen were William Rollinson, Indian-yellow; rosæflora plena, small, and clear rose; Eldorado, purple, bordered with yellow; Califorme, golden-yellew; Drapean, yellow, streaked with purple; Capella, velvety-chestnut; Drap d'Or, orango; Caméléon, cinnamon, bordered with yellow; Mont d'Or, deep yellow; rutilant, blackish-purple.

Considerable attention is paid to Ceanothus. It is found well to cover the base of these plants with dry leaves before winter in our rigorous climate. I may mention Ether, clear ultramarine; M. Verlot, greyishrose; Panthéon, carmine-rose, a variety with double white flowers; Cérès, rosy-mauve; Leviathan, ir n

grey; Othello, bluish-lilac; Brilliant, purplish-lilac; also two nunamed seedlings, one with fine dark violet spikes, the other the darkest blue known.

Some specimens of Gladielus Lemeinei and Nanceianus were in bloom when I was there. Among them was one usually blooming at the end of June, when it is valuable. It is dwarf, the flowers well-shaped, of medium size, pure yellow with black spots. It is named C. luteus, and can be grown as is C. Colvillei albus.

Some time ago, MM. Lemeine endeavoured to cross Fuchsia Riccartoni with large-flowered single and double varieties, so as to obtain plants which would staud the winter in the open ground. They have succeeded, and the following are new in the market: Drame, Elysée, Télégraphe, Volontaire, Enfant prodigne, Profusion, Espérance, and Nester. These do well in the open ground if protected with leaves. The sepals are generally red; the single or double corolla is, in most, violet or bluish; the sizes of the blooms are not yet equal to those usually seen, the number of them is, however, considerable.

Another newer collection is that of hybrid Fuchsia myrtifolia. The firm has four or five varieties with elegant foliage, the flowers in quantities, and showing all the required characteristics of market specimens. These plants, collected in the autumn in a cool house, flower there during the greater part of the winter.

Another plant, which after the summer-blooming yields, under the same conditions, quantities of flowers, is Fuchsia Gerbe de Corail (F. venusta x F. bo'iviana). All the upper branches bear, in the axils of the leaves, long flowers with a fine coral tube, lobes of the same tint, and a large coral-coloured corolla. The blooms are so numerons, that they appear like one pyramidal inflorescence: the flowering lasts from early in the season in a cool or temperate-house. Another plant of the same origiu, Corne d'Abondance, is also cultivated.

Large-flowered Fuchsias are largely grown by M W. Lemoine. Among the finest varieties are Countess of Aberdeen, a curious plant, sepals and petals slightly rosy-white; Christophe Colomb, very large flower, double, tender rose, the cup scarlet; Pasteur, corolla full, pure white; Madame Bruant, corolla bluish-mauve, full; Capitaine Bruger, corolla full, blue-violet; Marcel Mormier, corolla full, salutonywhite; Princess May, cup flesh-coloured, white, corolla scarlet; Francis Magnard, corolla double, violet, mixed with rose and red; Madame Carnot, large full corolla, white, veined carmine; President Burdeau, flowers full, pure mauve; Alfred Rembaud. corolla full, reyal purple; La Fayette, long, double, prunc-coloured corolla.

On the occasion of a visit to M. Em. Mulnard's horticultural establishment, I noticed good specimens of Phyllanthus nivosus and Cibotium Schiedei, much grown by M. Mulnard; Poinsettia pulcherrima grown because of its leugth of stem (nearly 6 feet), which makes it valuable for dressing tall vases when mixed with Chrysanthemums-sulphate of anumouia is used for them. Euphorbia jacquiniflora is also valued as a cut flower; Myrsiphyllum asparagoides (Medeela asparagoides), Lomaria neo-caledonica and L. gibba, Solanum nicotianum, fol. var., always in request, especially in Paris. Also Cyperus gracilis, Hedychium Gardnerianum, grown in small pots, watered twice or thrice daily, and given a little heat; quantities of Orchids, for the flowers of which there is, in Lille, always a great demand.

In the open ground I remarked Griselinia m crophylla grafted on G. littoralis, in five plants with large shining leaves; Ceanothus Marie Simon, the hardiest Ceanothus (ie the Lille Botanie Garden this variety is uever killed by frost); Pyrethrum uliginesum, with large white flowers like those of Japauese Anemones, Whirlwind, with Anthemis. large white semi-double blooms, plant fairly strong, of good habit; and Lady Ardilaun, a sturdy variety, flowers and stems longer than those of alba. Boltonia latisquama flowering abundantly; Geum coceineum, flor. semi-pl.; Cytisus Schipkænsis, a dwarf species

from the Balkans, sending up high tufts from a stock bearing pretty white blooms-a useful plant for the rockery; Scabiosa caucasica, with white and with blue flowers; Aralia (Fatsia) papyrifera, a valuable ornamental plant, cuttings made in February yielded fine specimens with large leaves; Dahlia Madame Mulnard, flowers like a double Cactus, golden-yellow streaked with carmine-red; a pretty collection of open-air Ferns, including Cyrtomium (Aspidium) falcatum, which lives through the winter indoors even with no fire; and seedling single Dahlias. I also saw Antirrhinum majus from cuttings made in September in a cold frame, where they passed the winter; in spring they were repotted in a hot-hed, and afterwards set out in the open ground, where they flower early and abundantly. Ch. De Bosschere.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr, for the period named: and this combined result is expressed in Daydegrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending October 24, is furnished from the Meteorological Office :-

"The weather during this period was brighter and less rainy than of late over England, but very unsettled, with a good deal of rain over Ireland and Scotland. Sleet showers were experienced from time to time at many of the northern stations, and thunder and lightning occurred in the south

and south-east.
"The temperature was much below the mean, the deficit ranging from 5° in 'Ireland, N.' and the 'Channel Islands,' to 7° in the 'Midland Counties,' 'England, S.W.,' and 'Ireland, S.' The highest of the maxima were recorded, as a rule, on the 24th, and ranged from 56° in 'England, S.' and the 'Channel Islands,' to 50° in 'Seotland, E.' and 'England, N.' W.' 'England, S.' the depict of the public which were recitation. N.W.' The lowest of the minima, which were registered on rather irregular dates, ranged from 18° in 'Scotland, E.,' 21° in 'Scotland, W.,' and 22° in 'England, S.W..' to 31° in 'England, S.,' and to 40° in the 'Channel Islands.'

"The rainfall was less than the mean in the 'Midland Counties,' England, N.W. and S.W.' Scotland, W.,' and 'Ireland, S.,' but more in all other districts.

"The bright sunshine did not differ very materially from

the mean, being in excess in most parts of England, and rather below or just equal to the normal in the western and northern districts."

MARKETS.

COVENT GARDEN, OCTOBER 29.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that those quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply m the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ep.]

GLASGOW: October 28 .- The following are the averages of Glassow: October 28.—The following are the averages of the prices current at market during the past week:—Pears, 2s. to 3s. per case; Apples, 4d. to 8d. per lb.; Tomatos, Guernsey, 4d. to 5d. do.; do., Scotch, 7d. to 9d. do.; Plums, 3\frac{1}{2}d. to 4d. do.; Grapes, home, 2s. do.; Turnips, white, 2s. 6d. per dozen bunches; Swedes, 1s. to 1s. 3d. per cwt.; 28. 6d. per dozen bunches; Swedes, 1s. to 1s. 3d. per cwt.; Savays, 16d. to 1s. 3d. per dozen; Cabbages, 8d. to 9d. do.; do., late, 1s. to 1s. 6d. do.; do., Red, 2s. 6d. to 3s. do.; Cauliflowers, English, 2s. to 2s. 6d. do.; do., bunch, 6d. to to 1s.; do., Dublin, 2s. to 2s. 6d. do.; Parsuips, 4s. 6d. per cwt.; Herbs, 1d. to 2d. per bunch; Leeks, 1s. to 2s. d. per dozen bunches; Mint, green, 6d. per bunch; Onions, Dutch, 3s. to 3s. 6d. per bag; do., Portugal, 10d. per stone; do., Globe, 3s. to 3s. 6d. per cwt.; Parsley, 5s. to 6s. do.; Greens, 4d. per bunch; Celery, table, 2s. to 2s. 6d. do.; do., common, 9d. to 1s. do.; Potatos, best, 8d. per stone; Carrots, 3s. to 4s. cwt.; Artichokes, 12s. to 16s. cwt.; Peas, 1s. 9d. to 2s. 6d. per stone; Cacumbers, 4s. to 4s. 6d. per dozen; 38. to 48. ewt.; Artichokes, 128. to 108. ewt.; reas, 18. au. to 2s. 6d. per stone; Cucumbers, 4s. to 4s. 6d. per dozen; Lettnees, 6d. to 2d. per dozen bunches; do., Cos, 9d. do.; Radishes, 9d. to 1s. do.; Horseradish, 2s. per bunch; Beans, Broad, 1c per stone; do., Freuch, 6s. 6d. per sieve; Scarlet Runners, Is. & d. per stone; Mushrooms, Is. to Is. 3d. per Ib.; Rhubarb, 2s. per cwt.; Bectroots, 7d. per dozen; do., new, 3s. to 4s. per dozen bunches; Cress, 3d. per backet; Brussels Sprouts, 1s. 6d. to 1s. 9d. per stone.

ENQUIRY.

" He that questioneth much shall learn much."-Baco:.

Cyclamen-buds not Opening. -C. B. II. writes: "I have a quantity of plants of white Cyclamen persicum, Butterfly, of a good strain, from Sutton of Reading, which are good plants, well set with buds, but these remain buds, and do not expand. Can you advise me as to the proper treatment! The plants are in a light, low house, kept at a temperature of 61°, and about 56 at night. Air is admitted during the day-time freely; the plants are standing on inverted pots on a cinder-bed, and are healthy, with large clean leaves; watering also has been carefully at-tended to. I shall be very glad if you will show me what I ought to have done, or not to have done, to produce the wealth of blossom which I am sure the plants are capable of bearing. The variety is White Butterfly. [Can any of our readers who are cultivators of Cyclamens suggest a remedy! Ep.]

APPLES IN STORE: C. I. There is no necessity for you to wipe the fruits, for when afforded air freely for a month after storing, the moisture that exudes from them will be dissipated. If a fruit-room is so constructed that sufficient ventilation cannot be afforded, then it may be advisable to wipe the fruits dry; and it will be well to place vessels filled with unslaked chalk lime in the room.

Chrysanthemums: T. A. The material sent is too meagre; kindly send a plant or two with roots and soil entire.

Cocumber Leaves Blistered and Deformed : J. B.No fungus discovered on the leaves sent. same are thin and deficient in substance, and we are inclined to think your methods of culture are at fault. Obtain advice from some good gardener in the neighbourhood.

MARKET GARDINING: G. R. Whether you would eventually succeed in getting a decent living if you engaged in Market Gardening depends on many things. We all know the stock story told of many self-made men, who usually, so the story runs, come into a place with their sole belongings secured in a pocket-handkerchief, or their last half crown in their pockets. With some energetic or simply lucky fellows the sum of money that you possess would be so well managed as soon to lead to a competency being obtained from trade. We cannot undertake to further advise you. NAMES OF FRUITS.

NAMES OF FRUITS.

A** The applications to name flowers, and especially fruits, are so numerous at this season, as seriously to humper us in the exercise of our editorial duties. They entail an expenditure of time, labour, and money, of which our readers have little idea. We are most desirous to oblige our correspondents as fur as we can, but we must request that they will observe the rule that not more than six varieties be sent at any one time. The specimens should be good ones, just approaching repears, and they should be properly numbered, and carefully packed. We do not undertake to send answers through the post. Delay in any case is unavoidable. in any case is unavoidable.

Mells. 1. Catillac—a stewing Pear; 2, Duchesse d'Angouleme: 3, Pear ripe, Doyenné du Comice.

—IV. D. 1, Gravenstein; 2, not known: a local variety, probably.—A. J. B. 1, Vicar of Winkfield: 2, Hacon's Incomparable; 3, Beurré Diel; 4, Cox's Pomona; 5, Court of Wick; 6. Rosemary 4, Cox s Pomona; 5, Court of Wick; 6. Rosemary Russet.—J. Hawkes. 1, Swan's-egg; 2, rotten; 3, Court of Wick; 4, Beachamwell: 5, Reinette du Canada; 6, Hoary Morning; 7, Cox's Orange Pippin.—P. R. Pear not quite sure; the skin Pripin.—P. R. Fear not quite sure; the skin greatly bruised and rubbed. It is not Beurré Charneuse; might be Emille d'Héyst — The Major. 1, Shobden Court; 2, Marie Louise; 3, Nouveau Poiteau; 4, Beurré Superfin, 5, Easter Beurré et 6, Maréchal de la Cour.—D. R. 1, Beurré de Capiaumont, greatly decayed. 2, Emille d'Heyst; 3, Napoléon; 4, Beurré Diel; 5, Marie Louise d'Uccle.—J. T. H. 1, The Queen; 5, Marie Leuise d'Uccle.—J. T. H. 1, The Queen; 2, Bess Pool; 3, Pine Golden Pippin: 4, Wareham Russet; 5, Minchull Crab; 6, small Emperor Alexander —H. W. 8, Beurré Bachelier; 9, Beurré Sterckmans; 11, Napoléon; 12, Maréchal de la Cour; 13, Easter Beurré; 17, Winter Nelis (?).—J. W. Pears; 1, Marie Louise d'Uccle; 5, Bergadie M. Pears; 2, Viang of Winkfeld, 1, 8, Duclesse mote d'Esperen; 6, Vicar of Winkfield; 8, Duchesse d'Angoulème ; 9, Hacon's Incomparable. Apples : Gloria Mundi; 2, King of the Pippins; 3, Minchull Crab.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—J. C. S. 1, Cratægus punctata; 2, Pyrus spectabilis; 3, Cratægus Azarolus; 4, Pyrus lobata. (No. 4 is also known as Mespilus grandiflora, and is thought to be a hybrid between a Cratagus and the Medlar).—A. H. Without seeing your trees it is impossible to be certain of the identity of the specimens you send. 1, We suppose is Cedrus atlantica; and 2, is probably C. Deodara. F. Potter. Phaseolus Caracalla.—G. II. Geranium sanguineum, Geranium rotundifolium (probably). D. W. Ophiopogon japonicus, and Lastrea serra.—
W. M. Crassula hybrida.—A. B. S. H. Pinus
excelsa, Ligustrum ovalifolium.—J. B. J. 1, Aster novæ boracensis; 2, Dactylis glomerata variegata; 3, Begonia next week; 4, Aralia Vettelnii: 5, missing; 6, Maxillaria pieta. Correspondent. Cratiegus coccinea.

NOVILTIES IN BOUQUETS: Constant Render. The so-called shower bouquet, may be likened to corn falling out of one side of a large, wide-mouthed Ribbons of any desired colour are fastened round the handle of the bouquet holder, and sometimes bows of narrow ribbon are mixed with the flowers. A special kind of wire bouquet-holder is sold by florists, by means of which they are elevated above the table, &c., on which they are Any kinds of choice flowers in season are used in these bouquets; and those of pendulous habit or which can be mounted in drooping fashion may be employed.

Pear: T. T. Your specimen of Pear, Pitmaston Duchess, weighing 29\frac{3}{4} oz., is of an unusual weight, and it has only been exceeded by fruits of Uvedale's St. Germain and Catillac, grown in Jersey.

PRUNING FRUIT TREES: J. F. To afford a full answer to this question would trespass greatly on our space, and we therefore can do no more than give a few rules of general application. In the case of Apples, when young, that is, in the first and second after planting, or when signs are observed which point to the trees being quite re-established, the main branches, which may number four or six, should be cut hard back, say to within four or six inches of the point of divergence from the stem. Some do this when planting, and it may answer for trees that have suffered much loss of roots on being dug up; but we think that it is better to wait one year or even two before pruning back, the new shoots made by the tree after hard pruning being of greater strength. Having got a good break the year of pruning, and thinned out all the weak, therefore useless wood, the leading branches may be shortened, at the winter pruning, to within 1 to 1½ foot of the point from which they

spring. With this second pruning the trees, if they are standards, will have the foundation laid of perfect crowns, and they should be allowed to go away without any further stopping of the main branches, except in the case of those varieties which are naturally of a weak or pendulous habit, which m y need to have all the main branches shortened by a foot or so every year till the growth of the branches is reduced by heavy cropping. Nothing further will be required afterwards than to keep the middle part of the crown clear of spray, and to remove interlacing branches. Fruit spurs will form all along the main branches, these latter will in time throw out lateral fruiting shoots, but they themselves will cease in great measure in the course of years to carry fruit spurs. Standard Pears require much the same kind of treatment, having regard to the habits of the varieties to form long or short fruit-spurs, the former being usually asso-ciated with long-jointed, relatively slender shoots, or a pendulons mode of growth. Cherries should be once or twice severely pruned so as to form a proper number of main branches; the after pruning required to keep the trees from becoming entangled masses of shoots when young being more satisfac. torily done by finger-and-thumb pinching when the shoots are young and quite tender; much pruning of the Cherry with the knife tending to produce gumming—a fatal malady in the sweet varieties. The Morello and Belle Magnifique, a light red-coloured variety of Morello, will on the contrary endure a good deal of pruning with the knife or secatrur in the winter and early autumn without injury. For espalier and wall trees a modification of these rules is necessary, and more severe pruning and disbudding are required to obtain the shoots that will form the framework of the trees in the right places; in restraining the undue growth and production of breast wood by timely dishudding, in stopping this at suitable points so as to obtain fruit-spars, and in shortening the leading shoots at the autuma or winter pruning at half or one-third of their length, the former when the shoots are weak, so that dormant buds will break and furnish further fruiting-spurs, or shoots which can be turned into

STRAWBERRY PLANTS DECAYING: A. J. Botley. The plant sent is suffering from an incurable complaint, that of old age. Better plough them in, and plant anew on fresh land.

TOMATO: H. E. T. The Tomato leaves are not really diseased, there is no fungus present, but every appearance of the leaves having suffered from a sudden chill. M. C. C.

TOP DRESSING VINE BORDERS: T. F. This may be done at the dormant season if the dressing consists of soil and manure, the inert soil being removed down to the froots. Manurial dressings are more properly applied during the active season. If your Vines are apparently in a bad condition, lift and replant them; see Gardeners' Chronicle, p. 501, last week's issue.

VINES: R, M. We have carefully examined the leaves sent and the roots also, but fail to find the least evidence of attack from insects or disease We believe you must look for the cause of the premature discoloration of the foliage to the circumstances attending the culture given the Vines. No evidence of the first cause is afforded by the specimens, but there is presumably some constituent iu the soil present in undue quantity, as is the case when overfeeding has been practised.

JULY 23rd.

TWO SILVER BANKSIAN MEDALS

HAVE BEEN AWARDED TO US

1895

GARDEN PEAS COLLECTIONS OF

Royal Horticultural Society.

1896.

JULY 14th,

NEW PEA-

The superior merits of this new Pea have been recognised by the Committee of the Royal Horticultural Society, after competitive trials at Chiswick in 1896, who awarded it the highest distinction, three Crosses (XXX), and a First Class Award of Merit.

We ventured to predict this very fine Pea would gain appreciation from those who gave it a trial, and the many gratifying reports we

have received are convincing testimony as to its general excellence and popularity.

"Boston Unrivalled" is a remarkably handsome Second Early Marrowfat Pea, of the best table quality; height, 2½ to 3 feet; pods large, 5 to 6 inches in length, of the "Telephone" shape and colour, but more even in size than that well-known variety, there being from 9 to 11 fine peas in the pods; these mostly hang in pairs, literally covering the haulm, which is robust, and not subject to mildew.

The extraordinary productiveness of this Pea is a marked feature, and in our extensive trials of Peas has always been conspicuous for the profusion of its pods. As an Exhibition variety it has scarcely a rival, and for private gardens, or market growers, is alike valuable. and undoubtedly ranks as a decided improvement and great acquisition in profitable Horticulture.

Retail Price: Per sealed Half pint Packet, 1s. 3d.; Pint Packet, 2s. 0d.

For Present Sowing.

SUTTON'S PRIZE CYCLAMEN,
Mixed, per packet, 5s. and 2s. 6d. post-free. November is the best time to sow Cyclamen Seed. The Gordening World February 24, 1894, says. "While some cultivators grow their Cyclimens for spring flowering, Mesers. Sutton & Sons make a point of baving a display in the autumn which will last through the winter. The seeds were sown in November, 1892, and came into bloom in about eleven months. They have been flowering freely ever since, and will continue in presentable and handsome condition till six months have elapsed."

DICKSONS NURSERIES, CHESTER.

CHRYSANTHEMUMS.

OUR YEARLY INCREASE in the sale of OUR TEARLY INCREASE in the sale of both Plants and Cuttings arises certainly from the first that all varieties (100) are planted out and grown in open pure country fields, cut down early, not allowed to flower, large clumps removed, and replanted mear the glass and light Stock from these are purfect, and the secret why all those we supply carry success wherever they go striking easily, growing quickly, and producing larger flowers.

We cordially savite $\epsilon \, ll$ to

JULY 23rd.

TWO SILVER BANKSIAN MEDALS

HAVE BEEN AWARDED TO US

COLLECTIONS PEAS

Royal Horticultural Society.

JULY 14th,

1896

NEW PEA-1895.

The superior merits of this new Pea have been recognised by the Committee of the Royal Horticultural Society, after competitive trials at Chiswick in 1896, who awarded it the highest distinction, three Crosses (XXX), and a First Class Award of Merit.

We ventured to predict this very fine Pea would gain appreciation from those who gave it a trial, and the many gratifying reports we

have received are convincing testimony as to its general excellence and popularity.

"Boston Unrivalled" is a remarkably handsome Second Early Marrowfat Pea, of the best table quality; height, 2½ to 3 feet; pods large, 5 to 6 inches in length, of the "Telephone" shape and colour, but more even in size than that well-known variety, there being from 9 to 11 fine peas in the pods; these mostly hang in pairs, literally covering the haulm, which is robust, and not subject

The extraordinary productiveness of this Pea is a marked feature, and in our extensive trials of Peas has always been conspicuous for the profusion of its pods. As an Exhibition variety it has scarcely a rival, and for private gardens, or market growers, is alike valuable, and undoubtedly ranks as a decided improvement and great acquisition in profitable Horticulture.

Retail Price: Per sealed Half-pint Packet, 1s. 3d.; Pint Packet, 2s. 0d.

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 7, 1896.

SOME RECOLLECTIONS OF THE CHRYSANTHEMUM.

I THINK it was in November, 1841 or 1842, that my father hoisted me up on his shoulder to carry me in the then new Corn Exchange, Norwich, to see a Chrysanthemum show, and I remember as well as possible seeing plants with one flower in 5 or 6-inch pots exhibited thus:—

0 0 0

Also monster Drumhead Cabbages. I had then never seen the like before, and both left a lasting impression on my mind. No one thought of striking cuttings until April, and then grew and flowered them in 5 or 6-inch pets, just one flower. These were stood in pyramidal groups as above. No green baize or paper to cover the stage; all bare beards in those days. The following were some of the varieties:—

Tasselled Yellow Yellow Cluster Yellow Flame Large Lilac Changeable Pale Buff Cluster Pink Silver White Early Blush Golden Yellow.

About four or five years after this I made my way up to London with eager desire to see the streets paved with gold, that I had heard so much talk about in the country. One Sunday morning, to my surprise, wooden pavements were pointed out to me as showing the riches of London in the street. I could find no Chrysanthemums; hardly anyone had heard of them. After staying eighteen months I returned home. The Exhibition of 1851 became everybody's talk and anticipation. I again ventured to London in the autumn of 1850, going to Stoke Newington, where I was sent by my employer to see the Chrysanthemums grown by Mr. James in his skittle-alley at the Rochester Castle Hotel, Stoke Newington; flowers were so scarce in those days that any we could get were admired intensely. I also went to the show held in the old red-brick, low-pitched, dark Manor Rooms, with leaden casement, and small diamondshaped panes, in Church Street, and saw monster specimen plants of the loose half-incurved class which occupied the room round by the walls; there were few people, and I do not remember seeing a solitary cut bloom, only a few Chinese Primulas here and there. Nothing here surprised me like the Drumhead Cabbages I saw at Norwich.

Taylor wrote the first book on the growth of the Chrysanthemum about 1853. This was sold in almost every seed-shop, and it quite altered the old mode of cultivation. I continued to visit the Stoke Newington show, following them in the three different buildings in which they were held.

Well do I remember seeing in a schoolroom on the east side of Stamford Hill Road, oppesite the present Abney Park Cemetery, a quantity of the levely Geo. Rundle when first exhibited, no white incurve had before been seen to equal it, and talk of its loveliness ran through all ranks of Chrysanthemum growers. Mr. Heal, the exhibitor, and the raiser, G. Rundle, Esq., of Devouport, were the theme of conversation throughout the year, and in the following November fine specimen plants were seen at nearly all shows, and it was universally admired, for it was these bush plants which formed the chief show in those days, and their cultivation was carried to great perfection. Six plants composed the great class in those days, and I must say that it required more real skill than do cut-flowers at the present day.

About the year 1854, the society called a meeting at the Rochester Castle, with the object of passing a law that unless there were 2 inches of stem clear above the soil and between the branches, the plants would be disqualified.

The South of London began to get jealous of North London becoming so famous, and shows were held at the Horn's Assembly Rooms, Kennington. Four or five of the Stoke Newington and Stamford celebrities came and cleared the board of the best prizes. I was an exhibitor, and got 15s, for a large specimen plant. I think after this the great cattle show building at Islington was decided upon as the place for exhibition, and the old society organised a large show there. By this time several good growers had sprung up South of the Thames, such as James Weston, whose Pompons, perhaps, for symmetrical form have never been excelled; Glover, of Talse Hill, and Beecher, of Plumstead, the crack grower of the South. I think two of the above-named, if not the third, took first prizes. This show nearly broke the back of the great North of London Society financially. The plants shown were dwarf, and the building unduly large, and I do not think that I ever saw plants look so dumpy and out of place before or since--no green baize, no Palms, no edgings, and to fill the building they were "run out" so much that they looked as if they had been purposely scattered. At this show I do not think there was a single board of cut flowers, but there may have been, and if there were any they certainly were none of Mr. Lees' flowers. That I can youch for! Meanwhile, the love of the Chrysanthemum was taking a firmer hold on the public, shows sprang up in all directions; Salter, of "Versuilles" Nursery, Hammersmith, was introducing new kinds of great merit. Adam Forsyth, at Brunswick Nursery, Stoke Newington, was doing the same, and showing fine specimens at all the principal shows. Mr. C. Eyles was then at the Crystal Palace, and a show was arranged there the next scason to mend the disaster at Islington, and a very fine show there was, the result being the largest and best ever held up to that time. James George, now of Putney, had the old Christine, nearly 10 feet over. Mr. Charles Turnor was then exhibiting, and showed Julie Lagravere, remarkably fine, causing quite a sensation. I came in for a prize for a large plant of Drin Drin; this was about 1859. I and the late Samuel Broom, Temple Gardens, persuaded twenty-nine growers to assist in getting up a society for the district of Brixton Hill. I was much against its being beld at the "King of Sardinia," a publichouse, and I had to establish one at a school-room, and soon got all the support and promises from the gentry, and they gradually abandoned the pewter-pot, and came over to the school. I thus, in the face of great opposition, absolutely established the Brixton Hill Society, which from that year to the present has had the longest and best run of prosperity, certainly of any society in the South of England, and is to-day a model association, of whose happiness and welfare I am always proud to hear. The great event following this was the intro luction of Mr. Fortune's Japanese varieties; and the following are the descriptions under which they were introduced.

1. Aurinian. -Clear golden yellow, of immense size, and very double; this superb plant belongs to

the ribbon-flowered group, and is particularly distinguished by the breadth and massiveness of its wax-like netals.

2. Comet. — Bright orange-yellow, changing to chestnut-red; petals very long, and curiously twisted and curled, which gives to this flower the appearance of a large bunch of gold thread; good habit, free-flowering, and very double.

3. Leopard.—Bright Indian-red, with large yellow spots covering the surface of the petals—a most novel and singular combination of colour, resembling the curious markings of some of the Orchid family.

4. Red Dragon.—Red-chestnut, tipped with yellow, and sometimes spotted gold: the flowers, which are very double, and of immense size, are composed of long subulate petals of the most novel and elegant form, very free-flowering.

5. Tarantula.—A most singular flower, with a close button-like disc, and a single spreading ray of long, slender, tubular, golden florets, $7\frac{1}{2}$ inches in diameter.

6. Rold. Fortune.—Bright orange or amber, large, and very full; a splendid flower, flowering very lateone of the best.

7. The Duimio.—Pale pink, changing to rose-lilae; flowers very large, double, and of great substance—a showy and attractive variety of the ribbon-form section.

8. Wi;ard.—One of the most beautiful, flowering in the form of loose tassels, of a bright red-maroon colour, dwarf habit, free-flowering, and early.

-(From H. Cannell's "Floral Guide" for 1869.)

The result was a lot of prophesying as to their future success. At that time, as for a long time previously, and even after, we were contemptuously called "Glennyites." George Glenny, who wrote Properties of Flowers, and the weekly article in Lloyds, demanded that all flowers must be round, smooth, and as if mechanically made, colours defined. The public firmly believed in his dictum, and were infected by his love. Consequently, nothing could be more contrary to the public taste than flowers with long petals in the form of strips of paper or long silk.

Dr. Sharp, of Waltham Cross, whom I used to visit, was one of the best amateur growers, and a great raiser, particularly of the reflexed section.

In the year 1862 I visited Salter's Nursery at Hammersmith; J. & C. Lee's nursery was on the very spot where Olympia now stands, and here long greenhouses stood a short distance from the road, with a Quick-set hedge running pretty well half a mile towards the west—how different then to now! Salter's Versailles Nursery was directly opposite, on the other side of the main road to where Lee's nursery formerly existed. I was surprised at the few plants—perhaps fifty seedlings in a long Frenchlooking conservatory; but what they had were good, and the elder Mr. Salter spoke very freely and pleasantly about his having been the first to introduce the Pompous.

I called in at the new Horticultural Gardens to see one of the first shows in the then new conservatory at South Kensington. The late Mr. James, then at Isleworth, took 1st for six plants; Messrs, Veitch had a dozen stand of cut flowers, flat on the board-no raised cups in those days. These were the first wonderful Japanese kinds, of which I have given descriptions above. In the centre of the stand was a very fine incurved bloom of John Salter-the contrast was wonderful; no one, so far as I remember, saw the least beauty in the long twisted silk kinds, my friend with me observing, "Good job the introducer's name was Fortune, for he will never make one out of them." Neither did he, for there was no sale for these varicties till years after. I believe it was only I who could see a future before them, or the slightest hope of their being more acceptable to the public. It was sizethe secret of disbudding brought this, that made them popular. I continued advocating and growing them, and issued the following extract from my Floral Guide for 1869, which are, I think, it may be truthfully said, the first published instructions how to grow the Japanese varieties:

"These are certainly very novel in appearance, and

are distinct from the ordinary kinds of Chrysanthemum, and most of the varieties do not fully develop their flowers until about Christmas, and are therefore valuable on that account. They are no good for small specimen-plants, as their habit is rather long, and they require to be treated similar to the cutbloom varieties, that is to say, to let the plant grow upright with about two shoots; and all the buds rubbed off but about two or three, that is to say, the earliest and the latest. They require good cultivation. These mixed with Azaleas and other greenhouse shrubs in mid-winter, have a grand appearance. and will excite the curiosity and admiration of everyone, for their colours are very striking, resembling somewhat the plumage of tropical birds, and others have the appearance of tassels made up of various kinds of beautiful coloured silks, and others of narrow strips of paper. If damp is kept from them, they will continue blooming a long time."

I think it was the Stratford Society which held fine shows in those days, whose members first adopted my suggestions, and began to thin out their buds and grow them as I directed, to 8 or 10 feet high, with one or two flowers. This, I believe, was earried into effect at their show the following year, and so they got to be more acceptable. Shirley Hibberd and Samuel Broom of the Temple Gardens gave lectures in all directions, and wrote books. In 1875, Woolwich organised and held several splendid exhibitions in the Town Hall; Napoleon and the Empress Eugénie drove over from Chislehurst to see them.

Mr. Mongredien, of Forest Hill, fortunately had a sport from Mr. George Rundle of a lovely cream-colour. I purchased and sent it out, calling it George Glenny. Soon after this the latter also sported, and gave us a lovely bright yellow, afterwards called Mrs. Dixon. This was generally grown, and exhibitions eonsisted very much of what were called the "Rundles." Following this, about seventeen years ago, Simon Delaux sent over a set of eplendid, large, and distinct kinds. English growers re-mamed them, and caused great eonfusion. There was a hubbub, but French names were persisted in by the Hackney Society. This event brought about the establishment of the Floral Committee, and the beginning of all the good work of the National Society we now see going on.

After this the Hackney Society gave new life to the Chrysanthemum in London. Saunders and his brother were the first great growers and exhibitors of the incurved as cut blooms, and were for many years champions. Mr. Rainbow was secretary, and ultimately the late Wm. Holmes filled this office, held floral committees, gave certificates and used to exhibit; it was he (Holmes) who suggested that they should remove the old society's show to Westminster, as they had outgrown all the buildings at Stoke Newington.

After exhibiting at Hackney for two or three years, I followed on at the Aquarium, and for two or three years many very pleasant incidents could be related; its success was surprising. Certainly the most important alteration was made when at my suggestion the name of the Society was altered from that of "Hackney" to "National." This change of name the then president, Mr. Sanderson, the Orchards, late of Amherst Nursery, and many other members, most strennously and determinedly opposed; however, Mr. Holmes could see numerons advantages that would arise from it, and he ultimately earried his views. At the present time it has the largest number of members, and the greatest income of any society of its kind the world has ever seen. I showed, I think, the first single-flowcred Chrysanthemum at a meeting of the Royal Horticultural Society about eighteen years ago. Henry Cannell, Swanley.

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM × ARGO-STONEI (Argus × Stonei), new gard, hyb.

Tins pretty hybrid, which has been raised by Normau C. Cookson, Esq., Oakwood, Wylam, Northumberland (gr., Mr. W. Murray), bears a striking resemblance to the famed C. Stonei platytenium, and also to the best form of C. × Morganiæ, but its long downward-enryed petals have larger blotches than in either of the varieties named. The scape is 18 inches high, and bears two flowers. The upper and lower sepals are white, with many faint green lines radiating from the base, those near the margin being also slightly tinged with rose. The labellum is bright rose on the face, and white, with yellowish veining on the under side, which also shows the fold or groove extending from front to back, as in C. Stonei. The showy petals, which are 4 inches long, are yellowish at the base, and rose-coloured at the tips, the greater

gentleman that it was imperted with a large piece of Cattleya labiata, bought at one of Messrs. Sander's sales, and it is, therefore, presumably of North Brazilian extraction. It belongs to the Granadilla section, with entire leaves and free bracts. Its botanical characteristics may be gleaned from the description in the feet-note, and from the drawing made for us by Mr. Worthington Smith (fig. 97). The flowers are of a pale greenish or primrose-yellow, whence the name we have given to the species, and open in the dusk, closing in sunlight, a fact which suggests that fertilisation is effected by some night-flying insect. All the Passion flowers require the aid of

would be most suitable. The coronal threads are more numerous than they are shown to be in the drawing, M. T. M.

ORCHID NOTES AND GLEANINGS.

CYRTOPODIUM WOODFORDI, Benth. CYRTOPERA WOODFORDI, Lindl.).

In one or two districts of Grenada, this Orchid is fairly common. Along the road-side, on stiff loamy soils, it grows naturally, and also near at hand, its

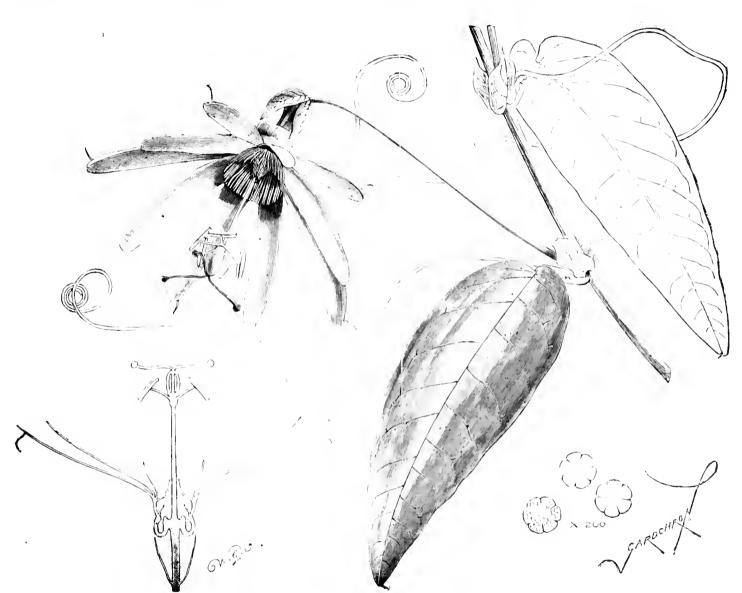

FIG. 97.—PASSIFLORA GALBANA: FLOWERS PALE PRIMROSE-TELLOW, TRAGRANT.

part of its length being decorated with shining irregular chocolate blotches. The staminode, which is a curious compound of both species, is yellow, with rose veining. James O'Brien.

PASSIFLORA GALBANA, Mast., u. sp.

For the opportunity of describing and figuring this heretofore unrecorded species, we are indebted to R. Creighton, Esq., of Filey. We learn from that

Passadora galbano, Mast., sp. nov. — (§ Granadulla) glabra, ramis gracilibus; petiolisad I cent. long., medio purpurascentibus glandulla. 2 sessilibus munitis; stipulis magusculis folinceis falcato-lanceolatis acuminatis; foliis membranaccicica b cent. long. 15 mill lat., cordatis oblongo lanceolatis. Lieuvis, nervo medio in austam breven exente; pedunculis gracilibus foliis longioitbus glaucis versus apicem articulatis; bracteis liberis subfoliaceis stipuliformibus a flore parum remotis; alabastris cylindrato-oblongis; flore pallid.

insects, and some of them are known to be incapable of fertilisation by their own pollen? The difficulty of defining what are to be called species, especially in Tacsonias, is thus accounted for. The present species is allied to P. Miersii, but the colour of the flowers is different, the coronal threads are self-coloured, not banded, and there are various other technical differences; for its culture, warm greenhouse treatment

flavente drio, chi i è cent, fragrante, crepusculo tantum aperiente; floris tubo glabro cyathiformi bosi intruso sepulis herbaccis oblongis apiè è cucullatis dorso sub apice corniculatis; petalis conformibos planiusculis prullo brevioribus pallicie flaventibus, cerona fauciali e filis pluriscriatis ligalifornibus concoloribus petalis dimidio bievveribus constante; corona incida breviete annulari, superie in filis pracedentibus 2-o plo bievvoribus divisa, corona basilari cupulari crassiuscula basin gynophori cingente, 35 nephoro tereti glabro; antheris luteis; ovario ellipsoideo glabro longitudinaliter costatum; stylis clavatis.

greenish purple scapes may be observed quite at home in swampy flat patches of land, peering out of the sedges and other swamp-loving plants. Its leaves simulate in situ somewhat those of a common Grenada-grass, namely, Panicium palmifolium. I am told by an old white settler—C. W. Proten by name—that the lower portion of the plant yields a viscid sap, by the aid of which broken wares may be repaired. Grisebach records, at p. 630 in his Flora of the British West Indies, upon the authority of Crueger, that in colour the flowers are "white with a yellow spot on the lip." This reference of colouring seems to me to raise a doubt as to whether Crueger did not mean Cyrtopodium cristatum of Grisebach, the latter lang—if my memory serves me correctly—a pure white, with a yellowish tint semewhere about the flower. When I saw it growing

in the Aripe savanna of Trinidad, it brought to mind the Lily of the Valley. Our Grenadan C. Woodfordi certainly shows no tendency to white, but on the other hand is decidedly of a brownish-green-purple colour. When collecting herbarium material last year, I noticed the flowering stem to be succulent and pliable, and the leaves brittle. It flowers during the months of Angust, September, and October. W. E. Broadway, Grenada, B. W. I. October 15, 1896.

CATTLEYA LABIATA.

I am sending yeu a flower of Cattleya labiata, which you will see has a double lip, or rather the sepals form another lip, and are coloured like the ordinary lip. I sent a bloom of this plant last year to several well-known Orchid-growers, who thought it was only a temporary freak, but advised me to take notice of its future action. The plant this year has nine flowers, and all are formed like the one enclosed, and the colour is very distinct from others blooming with it. I should be glad of your opinion of it as to whether it is of any more value than the ordinary type, and worth a distinct name. It is evidently a permanent deviation from the type. R. C. W. In the flower sent the two lower sepals were coloured like the lip, thus constituting the commencement of a "peloriate" flower. It is interesting to know that the plant retains this habit, and we should certainly advise that it be kept. It is too distinguished an individual to be named like an ordinary florist's flower! Ed.]

CYPRIPEDIUM INSIGNE SANDER.E.

This still holds the field among its associates, and is likely to do so until Mr. Sander or someone else gets the desired and desirable white one, even at a thousand guineas. A famous-grown plant of Sanderæ is in the collection of Geo. Shorland Ball. Esq. (gr., Mr. A. Hay), Ashford, Wilmslow, Cheshire. It has seven growths in exuberance of health, and is bearing three flowers, one of which was sent to the Drill Hall, at the meeting of October 13. If there has been only one plant of C. Sanderæ introduced, then all the plants of Cypripedium insigne Sanderæ ought to be the same; and if there be any difference it must be owing to cultivation. It is so valuable a plant up to now, rather increasing than decreasing in value, that all orchidists are interested in its history since first introduced. Mr. Ball's plant, with such vigour in it, has the largest flowers, up to now, I have seen. The colour is so enchanting, the green and the yellow so minutely blended, that it keeps one looking at it, and looking at it again. There is no doubt that if there is any blemish in it at all, it is in the minute spots on the dorsal sepal. The finish is exquisite. It comes to be proved whether rank or gross culture will intensify this spotting. The smaller flowers are more indistinct in this particularity. I should like to know personally whether there were introduced at any time any other plants of Sonderæ than the one sent out by F. Sander & Co. and if the original plant was big enough to be capable of having more than one variety in it. A cut flower off a plant does not show up nearly so well as when one sees the flowers growing on the plant. It seems far easier of culture than its compeer Cypripedium callosum Sanderæ. Nothing could be finer for its size than Mr. Ball's plant. J. A.

CATTLEYA AUREA VAR. STATTERIANA.

In the collection of Orchids formed by II. J. Hunter, Esq., of Grange Loan, Edinburgh, there is at present in flower a plant of Cattleya aurea, which from a most critical comparison with that figured in Lindenia, vol. viii., plate 356, is assuredly a specimen of this choice and hitherto unique variety; which is admitted to be one of the finest forms of the Warscewiczii section. The variety is one that is so very characteristic that it is not easily or readily misjudged, the flower itself has that substance and holdness of character which at once rivets attention; the labellum is large and flat, the central bind of the disc bright and intense purple, spreading towards the apex and gradually diminishing on either side back to the lobes of the column-thus giving the labellum the appearance of having a distinct band of purple and deep rese, which, contrasting with the rich orange-yellow veins, makes its beauty indescribable. The original plant worthily received a F.C.C. by the Royal Herticultural Society, September 19, 1890. I. I.

ODONTOGLOSSUM CRISPUM VAR.

The favourite Odontoglossum crispum is so variable, and the spotted forms so beautiful, and in a measure distinct from each other, that it is pardonable if the one who is lucky enough to flower an exceptionally good form considers it equal to the best. Such a variety has been kindly forwarded by J. T. Moss, Esq., Wintershill, Bishop's Waltham. It is of the O. c. apiatum class, or perhaps nearer to O. c. nobilior, illustrated in the Gardeners' Chronicle. Feb. 20, 1892, p. 235. It is a fine variety of the best type, and the greater part of the surface of the sepals is covered with red-brown blotches, while the petals bear a connected group of blotches in the middle, a broad white margin running round them. The flower also has a purple hue, and is altogether very beautiful.

CONFERS AT FORNHAM PARK.

CUPRESSUS NOOTKATENSIS VAR. FALCATA, syn. Thujopsis borcalis falcata.—Some fine plants of this Conifer at Fornham Park, Bury St. Edmund's, are worthy of note, now that the season for tree-planting is near at hand. The variety has a more graceful habit than the ordinary form, and is of distinct appearance even when seen at a considerable distance; and, as most persons will admit, there is too much sameness amongst Copressus when not observed at close quarters, that a variety which is distinct, when viewed at a distance, is a gain to gardens. A specimen of the C. nootkatensis falcata, planted in 1872, is now about 25 feet in height.

The collection of Conifers at Fornham is a very interesting one, and well worthy of a visit from the lover of trees. Some of the rarer forms noticed were -Pinus Balfouriana, distinct and pretty; Abies excelsa inverta, 10 feet high, very curious and distinct; A. bracteata, 15 feet, very pretty, the young bark showing red among the leaves; Juniperus Sabina tamariscifolia pyramidalis, in spite of its unwieldy name is worthy of notice; Juniperus virginiana pendula is also pretty; also, J. virginiana glauca. Good use has been made of the golden forms of Cupressus, Thuia, &c., which assist in brightening the appearance of the others considerably. Mention should also be made of Menziesii, Picea, or Sitchensis, which is seldom met with in such good form as here. A perfect specimen of this Spruce, 50 feet high, was noticed; and a very large, old tree of the glaneous form of Cedrus Libani, which is probably the largest specimen of the kind in Britain. Of the more common species, there are many fine specimens here which are well cared for. The soil is gravelly. W. H. Divers, Belvoir Castle Gardens.

CHRYSANTHEMUM CHAT.

(Continued from p. 582.)

SOUTHWARK PARK.

This is another open space in a locality that very much needed one, but the atmospheric conditions are far from congenial to the growth of plants, or even of hardy trees. The house in which the Chrysanthemum exhibition is held is T-shaped, but the arms are unequal in length. The plants are grouped together in the centre, and the group follows the shape of the building. Here and there it takes the form of a cone, and among the Chrysanthemums are interspersed a number of Palms and green-leaved Dracenas. A walk encircles these plants, and divides them from the stage that runs along all sides of the house. The bottom has been taken out of this, and Chrysanthemums are placed upon the ground, though at first sight they would appear to be dwarf plants upon the stage merely. The collection contains a good number of the hirsute kinds, amongst which we noticed the following: -King of the Hirsutes (yellow), Louis

Boehmer, and the white variety of same, the wellknown Hairy Wonder, Spartel (a lilac-rose coloured variety), Esan, Lady of the Lake, and W. A. Manda. The above kinds are all grouped together, and form a distinct feature. One of the newest of the Japanese we noticed was Mrs. G. Gover, with much-twisted florets, red with yellow reverse, and belonging to the "ragged" section, as a visitor in our hearing termed it; Madame Carnot, and a large number of betterknown varieties, bid fair to make good specimen blooms. Mr. Curle, the superintendent here, has upwards of 2000 plants. P.

Syon House.

The Chrysanthemums at Syon are now looking exceedingly well. A recent inspection, by the courtesy of Mr. Wythes, was afforded, and one could not but be impressed with the Autumn Queen's usefulness, either as a plant in a pot, or for the supply of the blooms when cut flowers in large quantity have to be provided, as at Syon. The aim of the cultivator is not so much to obtain them of full exhibition size as to have a supply that will meet the demand. The early varieties are now all in flower, whilst mid-season and late ones are coming on in the various glass-turns. There are in all about 1300 plants, half of these being treated as "cut-backs," and the others in standard - form. In height the plants vary from 3 feet and upwards. They are holding their foliage remarkably well, and it is of a healthy green colour. They occupy in all eight of the houses in the long fruit-range, in which the Vines and fruit-trees are at rest. The plants are grouped effectively, each variety being kept by itself instead of being indiscriminately mixed, and are thus easily observed, and the effect is good. Amongst the most prominent just new areof the Japanese varieties: Elaine, Charles Davis, Amos Perry, John Lightfoot, W. Tricker, and Mrs. C. H. Payne; and of the incurved: Baron Hirsch, Jeanne d'Arc, Brookleigh Gem, Emily Dale, Golden Queen of England, and Queen of England. Of others just expanding amongst the Japanese are, Madame Carnot, Etoile de Lyon, Viviand Morel, Miss Dorothea Shea, and Hairy Wonder, all of which promise well. There are also a few good bush-plants grown; these consist chiefly of single-flowered and the decorative varieties, amongst which Jane is one of the best, the plants of this useful variety being wellformed bushy heads. Of others, Lady Selborne, Source d'Or, and Avalanche are specially good. H.

MR. W. WELLS, EARLSWOOD.

Among the many successful trade growers whose enthusiasm and interest are mostly directed to the propagation and growth of the Chrysanthemum is Mr. Wells, whose place of business adjoins the railway-station at Earlswood. Mr. Wells is, in fact as well as in name, a Chrysanthemum nurseryman, for very few other plants find a place in his establishment.

Mr. Wells has exhibited well at the early shows this season, and has obtained several Certificates for continental and other novelties. The interest attaching to the early shows, however, was as nothing compared with the great Jubilee festival which is held as these notes are published. A week ago preparations for the coming struggle were in full progress, but our attention was not so much concerned with the group then being placed together in one of the houses, as with the general collection, which was found to include very many of this season's novelties, and of others that were seen but little last year. Mr. Wells has so many of these that our notes are upon those only that were specially attractive. One of the foremost was Mons. Chenon de Leché, one of last season's novelties from Calvat; it has already been described many times, and has been figured in the Gardeners' Chroniele from a plant grown at Earlswood. An Award of Merit was obtained by the variety at the last meeting of the Royal Horticultural Society, but we had not previously seen it so large. It is evident that when grown well, and the colour is good, this reflexed Japanese is a most distinct and desirable variety. Close to this was a plant of Mrs. II. Weeks, an incurved Japanese, also of last season, an Englishraised seedling of much merit; and Lady Byron, too, which will prove to be a very popular white Japanese

Although Esau, a hirsute variety, was sent out by Mr. Jones, of Lewisham, at the same time that Hairy Wonder was distributed from the same establishment, it is much less often seen than the latter, the result, no doubt, of its being less easily cultivated. In Mr. Wells' collection it has done splendidly—this season has been favourable to it, and seen thus it is more attractive than the popular Hairy Wonder. It has a yellow centre, and the rest of the florets are pale lilae-pink. The flower is close, globular, very full in the centre, and exceptionally hirsute: Baron Adolphe de Rothschild (Calvat) is a white Japanese, from the raiser of Madame Carnot. It is of the same type of flower, but quite distinct, and will probably be equally large. General Roberts (Owen) is a very large Japanese, and of a good colour, but apparently the bnd taken should be an early one.

Perle Dauphinoise (Calvat) is catalogued as a true incurved. As seen here, it is yellow with shading of pink. The flower is of good size, but it is one of the "doubtful" incurved; as is also Ma Perfection, a pure white flower from the same raiser, produced upon a plant of excellent habit. These incurveds need to be tried upon different buds, and for a second season, before their true character can be satisfactorily determined. Madaine Gustave Henry (Calvat), a pure white Japanese incurved, which was certificated to Mr. Wells at one of the early shows, is still to be seen, and is good in flower and habit. Many plants are in flower of Calvat's Australian Gold, which was described in our last issue upon it obtaining an Award of Merit at the Drill Hill. It can hardly be spoken of too highly, being of exceptionally good habit, and Mr. Wells has a number of plants which are being grown under conditions for testing its adaptability to market work. Indeed, in this collection a very preminent place is given to M. Calvat's novelties, and Mr. Wells appears to rate, at their true value, the many excellent varieties that have been received from this raiser during the last few years. Mrs. J. Lewis, a Japanese reflexed, described in our last issue, is another of this set. We mention Thomas Wilkios, a rich yellow Japanese, only because the blooms were extra good - better than Mr. Wells exhibited this variety at the October show, and he had some good ones there. A new flower of true incurved character is Harold Wells, a pretty yellow sport from Sir Trevor Lawrence. Le Rhone is a wellknown variety of very late habit, generally seen in bloom during January, and even February. There are some good flowers out here already; they were obtained by stopping the shoots in March, and again in July. Remarks might be made upon many more varieties in the Earlswood collection, but time and space forbid. Enough has been said to indicate that the show to be seen there is an extensive one, that it includes a large number of nevelties, and that Mr. Wells cultivates them well. I'.

AT MR. W. DRAKE'S, CARDIFF.

l had recently the privilege of visiting the nursery of Mr. W. Drake, at Cathays, Cardiff, and the Chrysanthemums which I saw there would lead one to expect some excellent blooms at the various exhibitions yet to be held. The nursery in question is devoted almost exclusively to Chrysanthemums, and many of the newest and hest varieties yet raised are included in the collection there grown; several of the novelties are, indeed, acquisitions. The past season of extremes has, apparently, suited Chrysanthemum - culture admirably, and damping of blooms, which the dull wet weather of the last month would lead one to expect, has made itself felt exceptionally little. I noted the following as the best varieties grown by Mr. Drake :- Mme. Carnot, a beautiful Japanese white, very large flowers; Edith Tabor, a handsome yellow Japanese, of fine size, and probably the best of this season's novelties; Mons. Panckoucke, another good yellow; the Vicar of Exmouth. also one of this season's novelties, a very striking crimson variety, and will, no doubt, be seen frequently at the exhibitions. Mrs. W. H. Lees, a fine large white flower slightly tinged with pink, is a charming variety; Lady Ridgeway is a new Japanese incurved, florets of a salmon-pink colour; Mrs. C.

Blick, a Japanese white; and the Beauty of Teignmouth, a fine rose-coloured variety, are all good. Many more were worth notice, but the foregoing are the very best in this collection. P. W. C.

AT DOWNSIDE, LIATHERBEAD,

The collection of these flowers annually grown in Mr. Alfred Tate's garden is invariably one of the very best in the kingdom. Having as an experienced grower a very high opinion of his flowers, it is no matter for surprise to learn that Mr. Mease purposed taking part in all the leading classes at the Royal Aquarium shows during the current week, and ere this appears in print everybody will know how far the grower's confidence has been justified. I was fortunate enough to see the blooms on October 31, before one had been cut, yet while they were nearly at their best. Two large, long span-houses, opening one into the other, are filled with the plants. and to enable visitors as well as workers to see the blooms to the best advantage by the aid of stout trellises, the alleys are lifted to the level of the sidestage and centre beds, so that whilst the blooms are fairly near the glass, everyone can be seen to the best advantage. Many other plants, however, occupy positions elsewhere

A very marked feature is found in the comparative dwarfness as well as moderate wood growth of the plants. Mr. Mease does not feed highly, but he does seek to obtain for his plants first-class turfy loam. mixed with well-decayed manure, and he pots his plants comparatively hard. Put whilst some growers have during the late hot weather been employing liquidmanure almost daily, forcing very strong stems and luxuriant leafage, he gave his plants weak manure-water about twice a week, and a little dry manure sprinkled about the surface of the soil once in three weeks. Thus when the excessive wet of September came, the roots being of a hard wiry nature, and the foliage not unduly strong, the plants seem to have suffered nothing; whilst other growers who were high feeders found under the heavy rains, roots soft and perishing, or luxuriant leafage absorbing food at the expense of the flowers. Judged by the results, the moderate feeding and watering at Downside seem to have been very successful, for the blooms are indeed splendid. the Japanese being in fact the finest ever grown there ; whilst the incurved, if a little later, are all the same wonderfully good. If in the big Aquarium classes Mr. Mease is beaten, then must the winning flowers be entitled to rank amongst the finest ever seen. The Japanese section has now so many whites and yellows, that these two colours seem to largely dominate all others. But they comprise some grand varieties. The Downside collection includes such high-class opes as Mutual Friend, Mdlle. M. A. de Galbert, Madame Carnot superb), Western King, new and splendid; Simplicity, regarded as superior to even W. H. Lees; Niveus, La Petite Amie, Madame Thérèse Rey, Madame Achalin, and Mrs. Weeks, with various others. Then of yellows, Oceana, Thos. Wilkins, Mons. Panckoucke, Phoebus (a splendid reflexed, a dozen blooms of this being ready for the American Gold Medal), Pallanza, Wm. Slogrove, La Moucherotte. Amiral Avellan, Sunflower, Robert Owen, Modestum, a noble incurved; Lord Brooke, &c.: and of pinks and darker hnes, a few noted hurriedly were Viviand Morel, Charles Davis, Col. Chase, most beautiful; Viscountess Hambledon, Louise, Etoile de Lyon, in fine colonr: Mons. Gruyer, President Borel, M. Georges Biron, Duke of York, Pride of Madford, both very fine; E. Molyneux, M. Chenon de Leché, Wood's Pet, Miss Dorothy Shea, Anstralie, Col. W. B. Smith, Mrs. C. H. Payoe, Madame Van Heede, &c. Then of incurveds, very fine indeed were C. B. Whitnall, C. H. Curtis, Robert Petfield, M. P. Martignan, Major Bonnaffen, Robert Cannell, M. C. Houghton, Princess of Wales, Jeanne d'Arc, Violet Tomlin, Princess Beatrice, J. Lambert, Mrs. H. King, Brookleigh Gem, Mrs. F. Hepper, Flora Maedonald, all the Queen and Empress sections, and indeed many others too numerous to name. This selection, however, suffices to show how representative the Downside collection is, A. D.

AT WOODBLATCH LODGE.

Amongst very many private establishments in which Chrysautheniums are grown for the production of large-sized blooms, the garden of T. B. Haywood, Esq, near Reigate, is one of the best known. Mr. Haywood is a gentleman who takes much delight in his garden, and is seldom better pleased than when he has a display of more than usual excellence to exhibit before his horticultural friends. In Mr. Salter he has a gardener who is cothusiastic in matters pertaining to Chrysanthemums, and in every other department, whether indoors or out-of-doors, there is more than usual neatness and efficiency attained. Judged by previous displays at Woodhatch, the collection in bloom at the present time is one that should give employer and gardener cause for much satisfaction. Some of the Japanese varieties are splendid; yet on the whole, we think the incurved section has been grown with equal success. It is a relief-such as many collections do not afford-to notice the attention given here to the less popular types, and to admire very fine flowers of the Anemone, Pompon, and single-flowered sorts. Flowers from Woodhatch are generally to be seen early in the season at the Crystal Palace Show, but as this event will not take place this year, the flowers will not be exhibited until later, for they are never sent to the Aquarium.

One of the first varieties we noticed in this collection was one from Australia, named C. B. Haywood; it is a white Japanese, florets moderate in width and length, but the flower builds up to a great depth, and looks as if it would resist considerable ill-usage from packing, &c. M. Chenon de Lechè was perfect in colour and size. Surprise is a fine habited variety, and has moderate sized Japanese blooms of carmine crimson, a good colour, and the florets are good. Close to this were capital blooms of Viviand Morel, but this is a very well known sort. H. L. Sunderbruch was also noticed as good here; and Mrs. Harman Payne, too, was particularly well coloured.

M. Ph. Dewolf is a yellow-flowered Japanese we have not observed before—it is promising; but close to it were fine flowers of Phorbus, with long broad florets of rich yellow a very graceful bloom. Yellow Japanese sorts are now very numerous and good, still it is thought that Edith Tabor will excel Phobus, to which it bears much resemblance. Reine d'Angleterre, as seen here, looked like a refined Etoile de Lyon of much better colour than that variety. Robert Flowerday is a very good colour, and for such is commendable; it is bright crimson, with silver reverse. Amiral Avellan is still another vellow Japanese, and an introduction of M. Calvat's; it has large breadth, and we have already seen it in many collections. There were some good blooms of Christine, and of the finely-formed purple-coloured reflexed flower Florence Luan. Major Bonnaffon has been described as an incurved, but we are not disposed to look upon it as an ideal one from flowers we have yet seen ; if staged as an incurved, it will require much making-up. Commandant Blussett is not so popular with many growers as with Mr. Salter, who grows it very well indeed; when the flowers open freely and and the florets are smooth and of good colour, it is distinct and desirable. Colonel Chase is pretty, although the flowers are not of the largest size, and the plants run rather higher than many others. King of Chrysanthemums produces very large blooms, light chestnut in colour, Japanese, with slightly incurving florets. The Anemone section was well represented, and we noticed very fine blooms of Deseartes, one of the best of the type ever raised; and of John Bnnyan, a yellow variety, that builds up a good cushion, and is in every exhibition collection.

We have already said that many incurved varieties were looking well. The Queen type in several varieties was good, and the flowers unfolding kindly and building well, but they are doubtless much more perfect now than when these notes were taken. P.

AT MR. GODFREY'S, EXMOUTH.

When visiting this excellent collection recently, I

was struck with the dwarf appearance of the plants and their robust health. The house in which they are displayed is 175 feet long, and was especially built for Chrysanthemums last year. Among some of the best in full bloom was Pride of Exmouth, a lovely lilac and white, some magnificent cut blooms of which were being placed on the boards ready for sending to the National Chrysanthemum Society, which I am glad to hear since were granted a Certificate. Mons. Hoste, which has shared the same honours. Warrior, a lovely terra-cotta, a decided improvement on W. W. Coles. Antonelli, with broad petals, pure white, a lovely flower. Mrs. Tucker Pain, much like President Borel, but richer coloured. J. E. Laker, a very beautiful yellow, slightly hairy. Calvat's Australian Gold is the best yellow in the collection, having immense blooms, without the least coarseness. One of the richest yellows was Modestum. Arona is bronze, shaded carmine; and Oceana is a lovely soft yellow colour, with broad petals. Mr. W. J. Godfrey was to be seen in quantity, with better blooms than ever, and it is likely to be included this season in most stands of cut flowers. Gold dust, a hirsute variety, was splendid; and La Moucherotte is in the way of C. Davis, but has much larger blooms, and they are shaded with bronze. Mons. E. Rosette is an immense flower, colour creamy-white; the guardpetals are long, narrow, and drooping. Captain L. Chaurie, after Lord Brooke's style, has broader florets and larger flowers.

The above are some of the best from a number of varieties in full bloom, but very many varieties have still to perfect their flowers. Beauty of Teignmouth is represented here in good form. It is strange that this variety and Pride of Madford were certificated by the Royal Horticultural Society last October as being identical. Pride of Madford was grown here in this neighbourhood years ago—a dull red flower, and discarded by Chrysanthemum growers, and is totally distinct from Pride of Teignmouth. D. C. Powell.

AT MR. 11. J. JONES'.

The position that the Ryccroft Nursery has attained in the Chrysanthemum world, in a comparatively short space of time, is a striking testimony to the untiring zeal of its director. Indomitable energy is seldom employed to little effect, and as this is one of the characteristics of Mr. 11. J. Jones, it accounts in some measure for the reputation he has won. In one instance alone-viz., in the exhibition and grouping of Chrysanthemnms -he has shown much more than ordinary tact by endeavouring, as far as possible, to disregard conventional methods in favour of others which possess originality, though possibly open to objection from other standpoints. A most zealous supporter, financially and otherwise, of the National Chrysanthemum. Society, we were not surprised when visiting the nursery on the 31st ult., to find Mr. Jones engaged in preparing his exhibits for the Jubilee Festival. It was known that there would be considerable competition in the class for a group of plants arranged for offect, and it was evident at Ryecroft that no endeavour was to be spared in making as fine a show as possible. Several innovations were spoken of, but when these lines appear in print there will be others also which will describe the nature of most of these groups, and what is very uncertain at present-the result of the competition. The Chrysanthemums in bloom occupy three at least of the houses at Ryecroft, and the largest display is to be seen in what is termed the large house. Here the plants are grouped on either side, and a scrpentine path in the centre divides them. Such a collection is full of novelties, and they are all of very recent introduction. Indeed, we missed some of the very best of known varieties, and when remarking upon same, the reply we got was in effect as follows :- "That variety and its characteristics are well known; we have ceased to cultivate it for the production of large blooms, and grow it merely for stock purposes." Thus we see such varieties as Madame Gustave Henry, Baron Ad. de Rothschild, and Viscountess Roger de Chezelles. The last named is one of this year's set from M. Calvat, a Japanese of old-

gold and orange colour; it has wide and long drooping florets, and is a desirable sort. Next there is a deep yellow sport from Primrose League; it is named A. H. Woods-the flowers of the type and sport are apt to be thin, nnless well cultivated, but when perfect they are graceful, the florets being exceptionally long. Western King is the name of an incurved Japanese from America, which promises to be very good; it is white, with pale lemon centre, and builds up a deep, handsome flower. Matthew Hodgson is a novelty of the type of Mrs. F. Jameson, but may be a better colour, and it is said of it that the centre of the bloom develops more easily than that of the latter. The next variety we noticed was one figured in The Album, viz., Herbert J. Cutbush (Jones). This Japanese flower is of large size, the florets fairly wide and drooping; colour deep red with yellow stripes. George Langdon Jones) is another of the same set; it is of similar type to Edith Tabor -- colour canaryyellow. The florets are good, of fair breadth, length, and of unusual substance. In Mrs. Richard Jones (Jones) is seen a white Japaneso of distinct appearance; it builds up to a very great depth, but is not so broad as some others. We next noticed Madame James and Miss Elsie Teichmann, the latter being the same excellent variety as Mr. Shea exhibited at the last meeting of the Royal Horticultural Society. Mrs. C. E. Shea has been a little disappointing in many collections this season, but some flowers here had opened kindly, and promised to make very fine blooms. Perle d'Or may be termed a fine new yellow variety of the hairy section, but it is much less hirsute than others, yet the florets are good and the flower pretty. Duchess of Fife, Madame Carnot, and Amiral Avellan were all noticed with good flowers; and especially distinct and good is the new Australie, a Japanese incurved with very broad florets, the reverse of which is clear silvery when the flower is perfect, the reverse only is seen, and it is exceedingly handsome. In Modestum we see a first-rate incurved Japanese from America; the florets are very fine, and the rich colour glorious. Madame Desblane is a largo flower of true incurved type and French origin. The florets are crimson, but the reverse, which is most seen, is brown; it grows rather tall, and has very luxuriant foliage. Another quite new incurved flower is Yvonne Desblanc; the flowers are creamy white, but were not perfect when we saw them. We have only been able to mention a few of the novelties to be seen at this establishment.

It is well known that Mr. Jones has undertaken the cultivation of Pelargoniums and Begonias in addition to the Chrysanthemum, and we were surprised to find that since our last visit he has built two additional houses, upwards of 200 feet in length. One of these is now full of zonal Pelargoniums in flower. The culture of other florists' flowers, and of Ferns also, will doubtless follow. P.

(To be continued)

EGYPT.

EXPERIMENTS WITH FIBRE PLANTS.

AGAVE RIGIDA VAR. SISALANA. - With a view to utilising tracts of desert land for the cultivation of fibrous plants, the Egyptian Government obtained from Florida, in 1894 and 1895, a number of suckers of this Agave. These were planted for experimental purposes at different places in Upper and Lower Egypt, under the direction of Mr. E. A. Floyer. The result, so far as the growth of the plants and obtaining of new suckers, has been very satisfactory. Under the direction of Mr. Walter Draper, Director of the Government Gardens at Barrage, some thousands of Agaves are new being transferred from their nurseries to their permanent quarters in the Behera Desert, the object being to prevent the drifting of the sand into the canals, and to obtain a return of fibre from the plants.

Owing to parts of the desert being inundated during high Nile, it is thought that when the plants become once established, their roots will be attracted to the moist sand below, and thus serve to maintain the plants during the parching heat of the Egyptian summer.

Experiments have also been made at Barrage to ascertain what amount of moisture the Agaves will stand without ill-effects, although it is generally known that water developes the pulf to the detriment of the fibre.

NYMPH.EA × ROBINSONIANA.

Amono the most useful, as well as the most beautiful, of aquatic plants is the race of hardy Water Lilies, introduced into commerce by M. Lazour-Marliac, of Temple-sur-Lot, France. The one of which we give an illustration (fig. 98) was grown at Gunnersbury by Mr. Hudson, and formed one of a group exhibited by him at a recent meeting of the Royal Horticultural Society. The leaves of this variety are of a dark blackish colour, sprinkled with dark claret blotches. The flowers are of an intense purple crimson, deepest in the centre, forming a contrast with the yellow anthers. The interior of the sepals is of a light rose colour. The flowers remain open during the day. The plant, with others of the same kind, was described in the Revue Horticole, 1895, p. 259, by M. Ed. André. M. Maurice de Vilmorin has also described several in the same periodical. The pareatage is not given, but from internal evidence there is not much doubt as to the species employed. Be this as it may, we cannot too highly commend these beautiful and hardy Water Lilies. We hope shortly to publish other illustrations, with notes on their culture, &c.

FORESTRY.

GERMINATION OF TREE SEEDS.

THE proper season to sow the seeds of various kinds of tree seeds is usually taken to be the spring of the year, and for many practical reasons this is no doubt the best and most convenient time. In spring the so-called dormant period is nearly past, and the seeds at once begin to undergo those changes which result in germination, whereas when lying in the ground through the winter months they are exposed to many dangers from birds, mice, and other animals, which may reduce their number considerably. But from a purely physiological point of view, it may safely be asserted that the most appropriate time to sow the seeds of all indigenous plants is at that season when they fall naturally from the tree or plant themselves. Fresh seeds, according to eminent authorities, contain natural ferments, which act upon the starch and albuminoid compounds of the seed in much the same way that pepsin acts upon animal food. These ferments being chiefly located in the seed-coat or husk, are naturally the first to feel the effect of outer influences, such as heat and moisture, and are probably the first to suffer from lack of them. It is a well-known fact that old seeds not only produce weaker plants, as a rule, than fresh, but also take longer to germinate. On the other hand, authenticated eases are common of the seed of various plants which have been buried at great depths in the soil for many years, retaining their vitality and germinating when again brought to the surface. These facts indicate the importance of the conditions under which seeds are kept between their ripening and subsequent germination, and prove that the less of vitality in seeds is chiefly due to the loss of moisture, occasioned by evaporation in dry air, for however impervious the seed coat may be relatively, porosity to some extent must exist.

The practical moral to be drawn from this is, that seeds from which strong healthy plants are expected must not be kept too long in a dry atmosphere, the limit being determined by the peculiarity of the plant itself. The seeds of many Leguminose, for instance, may remain dormant for many years, while those of the Walnut and Chestnut are useless if kept dry for two or three months. But confining ourselves to the question of sowing seasons and their influence upon the growth of the seedling, it is necessary to see wherein

the difference lies between autumn and spring-sown plants. Many who have not paid particular attention to the question of germination, are probably of the opinion that the growth of the plumule and radicle commence simultaneously, but such is not the case. In all seeds the radicle is the first to make a move, and is usually an inch or more in length before the cotyledons

probably be from 5 to 10, according to species and season. With autumn-sown seeds this root-growth is greatly promoted, owing to the longer period which clapses between the start in growth of the root and that of the stem. Under natural conditions, such seeds as Oak, Chestnut, Walnut, Sycamore, &c., germinate a few days or weeks after they fall from the tree, pro-

with which miceattack them during the winter months. A mixture of cow-dung, coal-ashes, and parallin laid in the drills with the seed will, however, usually prevent much damage being done in this way. The seeds of Ash, Hornbeam, Thorn, &c., which do not usually germinate until the second season after ripening, will sometimes start away the first season if j gathered

FIG. 98.—NYMPHEA ROBINSONIANA >: HARDY WATER-LILY. FLOWERS RICH CRIMSON; ANTHERS VELLOW. 18FE F. 558

begin to unfold. In the case of tree-seeds, however, this advance-growth of the tap-root is much more pronounced than in the majority of seedlings. During the first year's growth the above-ground portion of many tree-seedlings is confined to the development of a pair of leaves, in addition to the seed-leaves. But upon examining the roots, their growth and development will be found out of all proportion to that of the stems; and, supposing the length of the latter to be represented by 1, that of the former will

viding they are surrounded by moist leaves or earth: and should the following winter be fairly mild, strong healthy tap-roots will be developed by the following spring, although the cotyledous may still remain inside the seed-coat. Such seedlings, if injured by late frosts, or other vicissitudes of climate, recover much more rapidly than those which, after lying in store during the winter, are only just passing through the critical stage at the time of injury. The chief danger in sowing such seeds in autumn is the avidity

fresh, and sown at once; but a certain percentage will always lie over, and it is usually better to pit these seeds for a year than to lose half the seed, or keep the seed-beds clean the second year, which in some ground is almost impossible.

With tender seedlings, such as those of Conifera, Beech, &c., autuum sowing is very risky owing to spring frosts, and unless the seedlings are protected until mid-summer, late sowing in spring is usually the safest plan. A. C. Faches.

JOTTINGS FROM SYON HOUSE GARDENS.

It would be hardly possible to visit so extensive and well-managed a garden as that at Syon at any season of the year without finding much to interest the visitor. Comparing the years that are gone with the present time, it is evident that the opportunities for horticultural advancement are much greater now, and a visit shows this very markedly, being in almost every detail quite modern, in so far as is possible in a garden where evidences of the past are so apparent on every hand. Structurally, however, the numerous glass-houses are net modernised, and they are, therefore, not the lightseme and well ventilated structures ene is accustomed to see erected at the present day. Notwithstanding, there are net wanting in this representative garden evidences of high culture, so that in their seasons we see plants, fruits, and flowers that reflect great credit on an all-round good gardener. No young gardeners who are so fortunate as to be employed there will have reason to regret it, if they make the most of their opportunity of acquiring knowledge.

Of Orchids a choice assortment of the mere useful genera and species has been brought together, also a fine lot of Nepenthes, in splendid condition. The best of M. Marliac's hardy, cross-bred, Water Lilies, which, when established in the ornamental waters, will have a nice effect.

Fruit is a strong feature at Syon. In this connection a collection of single cordon Pears on a wall form a valuable objectlesson. The trees were planted of each variety in numbers in proportion to their merits. Some of the earliest fruits to ripen had been gathered while others were still hanging, and of the quality and colour of others still I was able to judge in the fruit - room a little later on. Particularly fine were the examples of Durondeau, and the crop was a heavy one. It is a reliable Pear for early September; while another showy early Pear is Conference. Louis Bonne of Jersey is highly spoken of at Syon; and Fondante d'Autonne they also regard as a first-class October variety. Another of merit is President D'Osmonville; Emile d'Heyst is a great cropper; Clapp's Favourite is also grown, as is also Marie Benoist. Souvenir du Congrès, King Edward, a good stewing-Pear; and Benrré Diel, the fruits of the latter on young cordon trees being magnificent indeed. The particular fruits to which this remark applies have heen characterised as among the finest ever seen of the variety. Numerous Pear-trees are planted in other positions against walls, and in the open. Strawberries, too, are grown by the thousand, and some 5000 plants in four or five varieties are potted annually for forcing, a considerable item alone when it is remembered that all the plants are raised at Syon, Vicomtesso Héricart du Thury, Royal Sovereign, President, and La Grosse Sucrée, being the principal, while Monarch and Leader are also grown; in the culture of this fruit in the open, Mr. Wythes has a system of treating them as annuals, so to speak, fruiting tho plants once, and afterwards reserving them for runners. In this way thicker planting is indulged in, and while fewer fruits are obtained from individual plants, these are of the very finest quality. Vines and vineries of course, abound, the fruit in many stages, and the pot Vines for earliest work already pruned and started at the time of my visit. The Grape growing department here is a large one, and fruit of high quality and in abundance is obtained.

Figs, too, are largely grown, some six dozen fine plans in pots being forced ready for March, the principal variety being St. John's.

Of Tomatos, a constant supply is kept the whole year, and those for winter fruiting are well set and swelling, and a succession for March in pots was represented by sturdy pot plants waiting their final shift. I cannot leave the fruit department of Syon without touching on Melons, for not only is Mr. Wythes a foremost grower of the fruit, but an ardent raiser of new varieties, some eight or more popular sorts having now been raised by him, and one called Syon House Gem is in

much demand for late work; and there is also another fruit here not usually seen in private gardens, or at least only those of large size, I mean the Banana, and to these alone two large houses are devoted, and a good succession of fruit thereby maintained. Musa Cavendishi is the favourite species, and suckers are planted at intervals as they are needed. In this way plants may be found in various stages of development.

Space forbids more than a mention of flowering and other plants under glass, of which there are some 1500 Chrysanthemums of all sections and the best varieties. There are also large batches of Emphorbia pulcherrima to be counted by hundreds, fine plants in the best of health. Calanthes, so exceedingly useful late in the year, are much grown; and a few hundreds of Cypripedium insigne, many other equally useful Orchids, principally such as best suited for cutting, were noted. Crotons are largely grown, the plants dwarf, compact, and well-coloured, and in almost endless variety. A reading-room for the winter was started a few months ago for the young gardeners. J.

THE WEEK'S WORK.

THE FLOWER GARDEN.

By Hedley Warren, Gardener, Aston Clinton, Tring. Gladiolus corms to be ready for storing, should be carefully lifted, the adhering soil shaken from them, not eutting off the stems, but letting these remain till they part easily from the corms, and laying them on mats in a light, airy shed, where they may remain till the soil gets dry, when they will be fit for storing after being cleaned, assorted, and labelled. If increase of stock be wished for, bulbils, which collect round the base of the old roots, may be saved, placing them in dry sand in bags or boxes.

Roses.—The planting of Roses may still be proceeded with in the absence of frost if the amount of planting is considerable. The present month is favourable for making cuttings of Roses, and Roses on their own roots are to be preferred where plants worked on Briar and other stocks quickly die off, which many of the II. P. varieties do. A cutting should be made from a strong, well-ripened shoot with a heel of older wood; it should not be less than 9 inches long, and is better if it is 12 to 15 inches. Having prepared a number of these, and kept them moist meanwhile, take out trenches with an upright face on ground that has been prepared by dressing with gritty soil and digging, and firm trampling, and proceed to lay the cuttings against the face about 4 or 6 inches apart according to variety, scattering at the bottom of the trench enough sandy-loam to bury the butt ends an inch, filling up with the staple, and making all very firm with the feet. The cuttings may range above the surface of the bed about 4 inches. To prevent in great measure the frost penetrating the soil, a mulch of half rotten manure may be put on it. The following are some of the varieties of the H. P. which strike readily from cuttings: Captain Christy, John Hopper, Countess of Oxford Depuy Jamain, Sénateur Vaisse, Hippolyte Jamain, Madame Lacharme, Charles Darwin, La France, General Jacqueminot, Exposition de Erie, Souvenir de la Malmaison, Chas. Margottin, François Michelon, E. Y. Teas, and many others. Sweet, Scotch, and Austrain Briars, Polyantha, Bourbon, China or Monthly, Prairie, some of the stronger Teas grow well from cuttings. Under the same kind Teas grow well from cuttings. Under the same kind of treatment, cuttings of the following do well: Ligustrum, Lonicera of all kinds, lvy, Ampelopsis, and Jasmine.

General Hints on Working.—Although much time is now occupied in sweeping up tree-leaves from the lawns, paths, and roads, and carrying them to the leaf heap, time will usually be found for bush and tree planting, and re-turfing, both of which the prudent man will try to forward during open weather. In some places the heavy rains will have put a stop to planting, it being an unwise proceeding to trample on the soil whilst it is very moist; still, advantage should be taken of every day when the soil is workable to push on the various jobs of planting. Herbaceous and other borders being necessarily in unsightly condition at this season, when the weather will permit decaying stems and leaves should be cleared off, and any necessary transplanting and dividing performed. The plants and bulbs for the spring flower-garden should be put into the soil without further delay. Pelargeniums and other bedding-plants in pots and frames, should be afforded just as much water at the root as will keep the plants alive;

any excess of it causing certain decay at this season unless much artificial heat be afforded, together with much ventilation, and neither is to be recommended for the present. Verbenas and similar plants should be kept very cool; and should mildew make its appearance, free ventilation will have to be given, and flowers-of-sulphur must be freely used on the plants.

FRUITS UNDER GLASS.

By W. Pope, Gardener, Highelere Custle, Newbury.

The Earliest Peach-house.—Where ripe fruit is required in April, the trees should be got in readines, for a start being made about the middle of the present month, and although fire-heat may not be needed for the first fortnight or so, the warmth must be kept from falling below 35°; merely keep the house close for that period of time, admitting air in the middle of the day only, and that for a short time when the warmth rises to more than 50°. It should be understood that the slower the trees are started into growth the stronger will be the blossom and shoots at the start. A thorough soaking of water (or weak liquid-manure if the trees are inclined to be weakly) should be afforded the inside borders where required; if, however, the roof-lights were removed during the autumn menths the rain will have sufficiently moistened the soil. When the house is closed commence to sprinkle the trees with tepid water in the merning, and also in the afternoons when the day is fine, but do not keep them always moist. Outside borders should be protected by adequate coverings of dry leaves, &c.

Succession Peach-houses. -As soon as the leaves have fallen, loosen the trees from their fastenings, and wash the stem, branches, and shoets with warm seapsuds, doing the necessary pruning soon afterwards. Former directions with regard to preparing foreinghouses should be carried out. When the pruning is finished, an insecticidal dressing may be applied, and the trees fastened to the wall or trellis. Make the ties loosely to admit of the shoots increasing in circumference, and so regulate the shoots that they are spread evenly over the entire area. Keep the houses cool, and only close the ventilators during periods of severe frost. If new trees have to be introduced, planting should not be delayed, selecting, if possible, those that have been periodically lifted, as such can be taken up with plenty of fibrous roots, and if carefully handled the trees will experience very little check from removal. It is the It is the better plan, too, to plant good-sized trees that will carry a moderate crop of fruit the first season, than small trees that will bear scarcely any fruit for two or three years. For the earliest crop a few trees of Alexander and Waterloo should be planted, for notwithstanding the fact that the quality of the fruit does not equal the older early Peaches, they are very precocious, and may be easily ripened one month in advance of those. A selection of good varieties suitable for growing under glass, given in the order of their ripening, would be Alexander, Waterloo, Hales Early, Early York, Abec, Stirling Castle, Grosse Mignonne, Royal George, Barrington, Princess of Wales, Sea Eagle, Walburton Admirable, and Golden Eagle. Of the earlier Nectarines are Cardinal, Early Rivers, Lord Napier, Stanwick Elruge, Humboldt, Pine Apple, and Violette Hative. Where late varieties have grown strongly, and have not as yet shed their leaves, a trench may be taken out about 4 feet distant from the stem and down to the drainage, the roots shortened, and the soil returned to the hole, a sort of treatment that checks the tendency to form late growth, and induces a more speedy ripening of the wood and foliage.

THE ORCHID HOUSES.

By W. H. White, Burford, Dorking.

Vandus.—The cultivation of these stately plants is frequently not attempted by amateurs on the plea that they do not produce sufficient bloom to compensate them for the space that the plants occupy; but this should not be, for when well managed, with leaves on the stems as low as the rim of the pot, they form, either in or out of flower, some of the most imposing objects in an Orchid-house. Vanda tricolor is what may be called an old plant, having been introduced to this country from Java in 1846. There are several distinct varieties of V. tricolor, all of which are well worthy of cultivation, viz., V. t. plantlabaris, V. t. Bassetti, V. t. Pattersoni, V. t. Dalkeith var., V. suavis, and V. s. Veitch's variety. If any of these plants require repotting, or if there be any doubts of the sphagnum-moss below the surface being decayed,

or in a condition not conducive to health, autumn is the best season to attend to their requirements. If a plant must be repotted because of loss of leaves at the base, the old material and drainage should be removed, and if there be found plenty of live roots some distance up the stem, so much of the lower portion of it may be removed as will bring the lowest pair of leaves, when the plant is again placed in the pot, almost down to the rim. Place the plant io the middle of the pot, and then put a few large crocks at the bottom, and over these a layer of sphagnum-moss, over which spread the lowermost roots, and carefully work in amongst them some clean crocks, and a moderate quantity of unchopped sphagnum-moss, pressing it down firmly, then distribute more roots in a like manner, filling up to within half an inch of the top, and finishing off with a cone of clean healthy sphagnum-moss, well mixed with small crocks. It is important that each stem be made secure by tying it to a strong neat saick. After repotting or topdressing the plants, no water should be afforded till several days have elapsed, and then water thoroughly. Afterwards, if the moss on the surface appears dry, it will suffice to lightly sprinkle it, so as to keep it alive. When a plant is established, the quantity of water may be gradually increased, but the moss must never be kept in a saturated state, it being advisable rather to keep the surroundings moist by damping the sides of the pots and the staging several times These Vandas require a coolish intermediate temperature, and after any disturbance of the roots, to be shaded from strong sunlight.

Habenarius,-At this season the lovely terrestrial Orchids, Habenaria militaris, H. carnea, and H. Susanne, form prominent plants in the warm Orchidhouse, but their flowering period is but short, and the plants then commence the resting stage. As soon as the flowers fade, the plants should be placed near the roof-glass, so that the newly-formed tubers may ripen thoroughly. The leaves will soon change colour, and the stems die down; but nothing should be remeved, but left to fall away naturally. When the foliage begins to get brown, water must be withheld gradually till the growths are decayed, when the pots should be placed on a high shelf convenient for examination of the plants during the winter months; for although they are then dormant, they must have water occasionally, or the tubers will shrivel. At Burford Lodge I examine them every week, and those which are found to be dust-dry are taken down and carefully sprinkled with tepid rain-water from a finerose watering can.

Cypripediums.—Plants of the following, Cypripedium grande ×, C. Sedeni ×, C. S. candidulum ×, C. calurum ×, C. leucorrhodum ·, C. longifolium, and C. albo-purpureum ×, which may have become pot-bound, should forthwith be afforded a liberal repotting. Afford the pots plenty of drainage, and pot firmly with lumpy fibrous peat and a little sphagnum-moss. To keep the compost porous, and consequently sweet, it is a good plan to mix nodnles of tufa with it, around which the roots of this section of Cypripedium entwine themselves luxuriantly. These plants grow very freely after becoming established, and should on no account be allowed to get dry.

Cattleyas.—The growths of the distinct-looking C. Lawrenceana will now be making considerable progress, some of the plants showing their flower-sheaths. It is important at this period to place them in the lightest possible position. The affording water to the plants at this stage requires much judgment, the young growths being liable to decay if there is any excess, especially in dull or wet weather. The new growths should be occasionally examined, as it sometimes happens that the flower-sheath adheres so firmly to the side of the growth that unless loosened the flower-spikes come deformed. Plants of C. Percivalliana which may have ceased to grow should be kept moderately dry at the root till the flower-spikes are seen to be pushing up the sheaths, when more water may be applied. This species of Cattleya should also be placed near the roof in the winter season.

PLANTS UNDER GLASS.

By JNO. McINTYRE, Gardener, Woodside, Darlington.

Forcing-house. — Numerous plants will now be arriving from the continent, and foremost, for usefulness, is Azalea mollis. The successful forcing of this variety depends upon the state in which the plants come to hand; and it is my opinion that plants when imported are frequently damaged in transit by the soil about the roots getting dry. Moreover, they

are lifted from the open ground a week, or probably a longer time, before the nurseryman here receives them; this dryness at the root is a very likely occur-When the gardener receives his Azaleas, they should be examined, an lif root masses are found to be dry, they ought to be moistened forthwith, and when the water has well drained away from them, the potting should be done. Never allow the plants to remainin some dry shed until time can be found to attend to this matter, but see to it at once. I have found that if the plants be forced without this very necessary attention, the flower-buds drop off instead of expanding. In many gardens, plants of Azılea mollis are brought on annually, no attempt is made to grow them for flowering a second year; but where economy in the garden is studied, it is prudent to prepare the plant for foreing a second year. The method that I adopt is, instead of turning them out of doors as soon as flowering is past, to remove them to an early peach-house to make their growth, and in the or early summer they are planted out, or plunged in their pots on a warm border with a south aspect. In the north the latter is best, summer is fine and warm, the plants do not fail to set plenty of flower-buds. In unfavourable years, the plants do not set well, they are not used for forcing, but remain in the border for another year, and in most cases good stuff for forcing is thus obtained. In potting Azalea mollis, light soil, two parts sandy loam, two parts good leaf-soil, should be used. It is advisable not to force the plants very early, but to afford them a good long rest in cold-pits; the first week in December is quite early enough for the first batch of plants to be placed in heat. Deutzias standing in the open should be potted up at this season, also any bought-in plants arriving out of pots. When potted, house them in cold-pits, where they will be safe from frost, where they should remain till placed in the foreing-house. Lily of the Valley imported crowns and clumps are now coming to hand. Some gardeners fail in early forcing Lily of the Valley, as was my own experience for some years, notwithstanding the healthy and strong appearance of the crowns on arrival. They were potted up, hoth crowns and as soon as received, and kept out of the reach of frost until wanted for forcing. I found that when thus treated they would not be forced early; and now, on the crowns arriving, they are buried in coal ashes in the open with the buds exposed to the We have now no difficulty in forcing them, three weeks being sufficient time to flower them. It is not necessary to pot the roots, but simply to fill a propagating case with cocoanut-fibre, and pack the crowns in as thickly as possible. Crowns early forced do not throw up leaves with the flowers, but to obtain leaves our own home-grown roots are lifted and forced for foliage to go with the flowers. A number of Dielytra spectabilis may now be lifted from the open ground for the purpose of being forced early in flower. As it is well known, this species is useful for decorative purposes when grown in pots, or for cut bloom. Some gardeners lift large clumps with all the soil that will adhere to them, and place in large pots: it is, however, I think, better practice to shake off the soil and cut the large masses into a number of small pieces, each having a bud or two and place four to six such pieces in 6-inch flower-pots. 6-inch flower-pots. There are numerous species prepared for foreing, viz., Lilae, Staphylea, Primula sinensis. Japanese Maples, Rhododendron hybridum, Solomon's Seal, all of which may be plnnged in coalashes in the open, or in cold pits with the sashes kept over them in hard weather. In potting the plants, make the soil very firm in order that water when afforded may not pass to rapidly away, otherwise the original root-mass may remain dry whilst all around is moist.

Mignonette will now have passed out of flower in the open border, and recourse must be had to that which is grown in pots. Everyone with suitable pits or house should grow this Mignonette for winter and spring flowering. At the end of the month of July, seed is sown in thumb-pots, and the seedlings are thinned out till four or five are left, and when these are established shift them into 60's, and then into 45's, in which size they ought to flower. Sowings for succession are treated similarly, and come at the last shift into 5-inch pots. The soil for Mignonette should consist of good loam two parts, coarsely broken lime rubbish one part, and sharp sand one part. Place the pots on a shelf that is near the glass in a pit or house having a temperature of 60° at night, and afford water only when it is really required, and only with the spout of the watering-pot, and then only in early morning. One of the best varietics for growing in pots is that called Matchet.

THE KITCHEN GARDEN.

By CHARLES HERRIN, Gardener, Dropmore, Maidenhead.

Tomatos.-Fruit cut from outdoor plants in a green state should be kept in a dry warm house to ripen. If any of these should decay, promptly remove them. Plants intended to furnish a winter supply of fruits removed from the cool-house they have hitherto occupied since they were brought from the open air. be placed in a warm house for ripening off their With fruits fairly advanced in growth no difficulty will be experienced in ripening them if sufficient warmth and air when the weather is fine be afforded, a close moist heat being strictly guarded The ventilators need not be quite closed unless the weather is very frosty, and a temperature of 5)° to 55° at night, rising from 60° to 65° in the day time, or more with sun-heat, will suit the needs of To assist the swelling of the fruits a very the plants. slight application of some sort of artificial manure should be spread over the surface of the soil in the pots occasionally, observing that less is required now than when growth is more active. The setting of late blooms will be attended with some difficulty; still, it may be done by going over the plants once a day at noon, when the weather is bright, and giving the rods a gentle tap to disperse the pollen, catching it on a piece of paper, and applying it to the stigmas with a camel-hair pencil. The next two months are usually the worst for the setting of the blossoms.

Cauli dowers.—In anticipation of frost of sufficient severity to injure the heads of the Autumn Giant Cauliflowers and Autumn-Protecting Broccoli, these plants should be lifted with all the soil that adheres to the roots, and transplanted closely together in pits where lights and other protection may be given them in hard weather. If no pits are available, lift and plant closely together in a sheltered position in the open, making walls of bracken or litter round about the patch, and covering the tops with the same kind of materials in frosty weather. The heads should be replanted in an upright position, for when growing if laid slanting-wise, the flower is liable to open, and become otherwise disfigured.

Scakule.—Roots of this vegetable, lifted a few weeks ago and left exposed to the slight frosts that have occurred in the interval, will start into growth fairly well when placed in heat of about 55° to 60°. If a small place at the warmer end of the Mushroomhouse can be boarded up so as to keep it perfectly dark, this will make a good place for forcing the roots. They should be packed close together in moderately light soil. Seakale may also be forced in 8 or 10-inch pots if an empty pot be inverted over each, and the pots stowed away in any warm corner or in a forcing-house.

THE HARDY FRUIT GARDEN.

By G. WOODGATE, Gardener, Rolleston Hall, Burton-on-Treut.

Transplanting.—The season for transplanting has arrived, but the land is in a saturated condition, and in an unfit state for the purpose. Trees received from a nursery should be unpacked on arrival, and laid-in in rows singly in some sheltered part of the garden, care being taken to cover the roots with dryish soil. In laying-in, the trees should be so placed that the branches cannot whip each other in windy weather. and the covering of soil should suffice to keep the roots moist; and to do away with risks from frost, some stable-litter should be placed on the soil. In laying down new Currant and Gooseberry quarters, the position chosen should be one in which it is easy to afford protection by means of nets, that is, the bushes should be altogether, not scattered about the garden, the quantity of netting required in the former case being much less than in the latter.

Proxing of App'e, Pear, Plum, and Cherry-trees,-In favourable weather, push on with the pruning of these trees, so as to get it finished early. attention was given the trees in the matter of disbudding and finger-and-thumb prining, but little will remain to be done at this season beyond the cuttingbuck those shoots which were pinched to five or six leaves to three buds from the base. The most awkward of the fruit-spurs should be thinned if very numerous, all dead wood removed, and the leading growths shortened to from 12 to 15 inches, according as the varieties are of robust or weakly growths, the latter being pruned the closer. Cordons and espaliers will require similar treatment, with this exception, that the leading should should not be shortened before they fill their allotted space, when they may be treated in the same way as laterals. time should be lost in lifting and shortening when practicable the main roots of all trees which showed exuberance of growth.

we hope in the next issue to be able to reproduce his drawing. Singularly enough, whilst we were engaged in opening the box containing this treasure, a letter was placed in our hands from Mr. WOODALL, of Scarborough, announcing the fact that the plant was also in flower with him; and now we learn that the plant'is also in flower at Kew. We reserve further particulars until next week.

Not very many, perhaps, of the Camoensia present generation will remember maxima. the excitement that was caused

by Dr. Welwitsch's discovery in Angola of this superb climber. It was speedily introduced into commerce by Mr. WILLIAM BULL, but it is little more than two years since we first heard of it flowering under cultivation in the Peradenyia Rotanic Garden, under the charge of our lamented friend, Dr. TRIMEN. In this country we have not heard of the production of flowers until a day or two since, when Mr. Bull roused the old interest by sending us a raceme which had been grown in the gardens of Mrs. Winthrop, Barton Court, Hungerford, under the charge of Mr. W. F. CONN. That head of flowers is in the hands of the artist, and

horticultural annals. It has witnessed the Chrysanthemum taking a foremost place among flowers in the popular estimation, and it has greatly fostered the development of the golden flower by endeavouring to popularise it in many ways. It has held, and is still holding, exhibitions of Chrysanthemums as surprising in extent as they are for the high quality of the blooms displayed. It encourages the development of every type of the flower, and presents it to public view in many attractive and utilitarian aspects. That it has imparted an enormous increase in the commercial value of the Chrysanthemum there can be no doubt. It has, by bringing many Chrysanthenium societies into affiliation with it, ramifications extending to all parts of our own country, and it has

a substantial hold upon some of our distant

Instituted in 1846 as the Stoke Newington Chrysanthemum Society, it had its first home in the "Amhurst Arms," in Shacklewell Lane, and it would appear that the original intention of its founders was to hold a fruit show merely; but as the Chrysanthemum was at that time rapidly rising in popular favour, it was also included in its programme by the promoters. Shacklewell is on the north side of Dalston

grown; but now, almost entirely covered with bricks and mortar in some form.

Of all those who took part in the inanguration of the Stoke Newington Chrysanthemum Society, not one, it is believed, is now living. The Society soon changed its quarters to the Rochester Castle, in Shields Alley; and from thence, later in time, it went to the Manor Rooms, Church Street, Stoke Newington. It was while installed at the Rochester Castle that a considerable amount of vitality was imparted

that time, but very few survive; Mr. J. George of Putney, is still among us, and a member of the National Society. The successor to Mr. Edwards in the presidency was the late Mr. E. Sanderson, first elected in 1861, and who filled that position with one or two intervals nearly up to the time of his death, a few years since.

The pioneers of Chrysanthemum culture in Stoke Newington adopted a somewhat unique method of paying their prize-money. All the money taken at the doors was divided into prizes

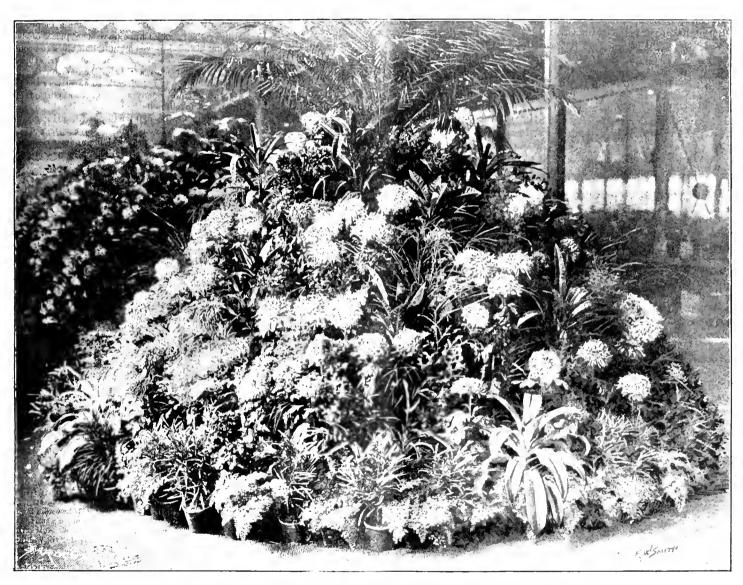

Fig. 100.—Group of Chrysanthemums, at the national Chrysanthemum society's show. Shown by H. Tate, Esq., Park Hill, Streathan, Surrey (gardener, Vr. W. Howe). (See p. 570.)

Lane, and was formerly (and probably is so still) a hamlet to the parish of Hackney. It lies on the east side of the Stoke Newington Road. It was then, doubtless, an open and breezy district, with its Manor House, and old family residences with large gardens, on the sites of which there is now a forest of houses. Ten years, and probably less, before the Society was formed, Stoke Newington consisted principally of one long street, extending from Kingsland Road to Stamford Hill, with abundant open spaces and gardens on either side, in which Chrysanthemums were

to the Society; Mr. ROBERT JAMES, the landlord, an enthnsiastic cultivator and exhibitor, was Treasurer; Mr. John Edwards, the then Secretary of the National Floricultural Society, President; Mr. George Glenny, Judge; and Mr. William Holmes, the father of the late Secretary of the National Chrysanthemum Society—then gardener to Dr. Frampton, Frampton Park, Hackney—was a member of the Committee. The Frampton Park Nursery, still in the occupation of his widow, is on a portion of Dr. Frampton's estate. Of those who were active workers in the Society at

on a pro-rate scale, and handed to the winners at a dinner which was usual on the evening of the show. Each man's pile was placed upon a tray, carried into the dining-room, and distributed; and the remark of the late Mr. Activate Wortley can be well understood when he said that it was no easy task to divide such a sum as £50 after the close of the show and pay it away the same night.

The leading varieties grown for exhibition cut blooms in those days were Annie Salter, Beauty, Christine (lilac), Phidias, and Queen of England, all of which can still be found under

their separate headings in the Jubilee Catalogue of the National Chrysanthemum Society; also Aristides, Campestroni, Duke, King, Pio Nono, Vesta, Defiance, Gem, Lysias, Nonpareil, Rebecca, The Warden, Themis, Formosum, Dupont de l'Eure, Pioneer, and Cyclops, some of which, in all probability, still exist in old-fashionel gardens.

Between 1865 and 1868 the late Mr. SHIRLEY HIBBERD was President. In 1871 the title of the Society was enlarged to the Stoke Newington and Hackney Chrysanthemum Society, and the following year the place of meeting was changed from the "Rochester Castle" to the "Lord Stanley," Mr. ROBERT JAMES having died in 1871, and the Society then became known as the Borough of Hackney Chrysanthemum Society. It was at this time that the late Secretary, Mr. WILLIAM HOLMES, became connected with the Society, and his active personality soon infused fresh vitality into it and its operations. In 1877 it was resolved that the annual exhibition should take place at the Royal Aquarium, and it was held there in 1878, and has continued to be held there since. In the early part of that year the late Mr. WILLIAM Holmes was appointed secretary, which office he held until his lamented death in 1890. Soon after Mr. Holmes' election, the home of the Society was transferred to the Mitford Arms hotel, near to Hackney Downs.

With the appearance of the Society at the Royal Aquarum, assisted by a subsidy from the authorities of the building, other shows were added to that usually held in November, and the Society entered upon an association which has greatly assisted to develop it. In January, 1884, the title was changed to that of the National Chrysanthemum Society, and its progress became more rapid still; its Floral Committee was instituted, its general committee enlarged, its rules extended to meet the requirements of its newly-broadened sphere of work; while the Chrysanthemum centenary celebration in 1890 found it connected with many provincial secieties by affiliation, and some in distant parts of the earth. It will be remembered that the late secretary died shortly before the centenary celebration, the lines upon which it was carried ont having been mainly laid down by him. Though scarcely successful financially, it yet exercised a potent influence in the way of popularising the Chrysanthemum.

The introduction of the Japanese type by the late Mr. ROBERT FORTUNE in 1862, not only imparted a great impetus to Chrysanthemum culture, but the rapid improvements in the type which soon followed, and the deep hold thoy took upon the popular taste, called into existence many Chrysanthemum societies, and added materially to the strength and importance of that now known as the National Society. The incurved type-attractive as it is-could never have called forth the floral enthusiasm the improved Japanese forms aroused in consequence of the extraordinary diversity they displayed. It is only in recent years that substantial progress has been made with the incurved flowers; the Japanese have gone forward by leaps and bounds.

The Jubilee Celebration finds the Society with some 870 members, nearly 100 of whom are Fellows, and there are in alliliation with it not less than 136 provincial, colonial, and foreign societies. The proposal to commemorate its Jubilee has aroused much enthusiasm, and called forth a degree of financial support of a most encouraging character; its Special Jubilee Fund has reached a sum of

£350; in addition it has a sum of £200, offered in the form of special money-prizes, in addition to valuable cups, plate, and medals. It is now trying the somewat hazardous experiment of holding two large exhibitions within the space of four days.

One most important branch of the Society's work has been that of cataloguing and classifying the almost numberless varieties of the Chrysanthemum which have appeared from time to time. Its first Catalogue was published in 1884, followed by an edition brought up to date, which appeared in 1886, and another was issued in 1888. In 1890 appeared the Centenary edition, a work of 108 pages, which, in addition to classifying most of the leading varieties, gave also an alphabetical list of all the varieties its compilers were able to trace. In 1892 appeared a supplement to this, and a second supplement in 1894, both superseded by the Jubilee edition, just issued. The latter is not quite so bulky as the Centenary edition, but is broadly comprehensive, one excellent feature being that the characteristics of the various sections of Chrysanthemums have been materially amplified.

The National Chrysanthemum thus appeals to the flower-loving public on the strength of the work it has already (and is still) accomplishing. It is an active force in horticultural matters, holding four exhibitious in each year, and though no one can regard the Royal Aquarium as in any way a fit place in which to hold flower-shows, yet the subsidy which comes from the connection enables the Society to keep so constantly before the public the Chrysanthemum as an exhibition subject during the last four months of the year. Some day we may hope to see a horticultural hall for the use of all the many societies now existent.

ROYAL HORTICULTURAL SOCIETY.—The next Fruit and Floral Meeting of the Royal Horticultural Society will be held on Tuesday, Nov. 10, in the Drill Hill. James Street, Victoria Street, S.W., 1 to 1 p.M. At 3 o'clock, lectures on "Seed-growing" will be given by Mr. R. FIFE, F.R.H.S., and Mr. James Long, F.R.H.S.

PROFESSOR C. C. BABINGTON.—In the hall of St. John's College, Cambridge, a day or two since, there was hung a portrait of the late Mr. C. C. BABINGTON, thirty-four years until 1895 Professor of Botany in for the University of Cambridge, and Fellow of St. John's. The painting was executed by Mr. W. VIZARD, of Brighton, and is the gift of Mrs. BABINGTON.

BUITENZORG.—The King of Siam, we learn, on the occasion of a recent visit to these celebrated gardens, conferred the Order of the White Elephant on Dr. TREUB. Dr. TREUB, no doubt, congratulates himself on the receipt of the symbol rather than of the reality.

NERINES. — Mr. H. J. Etwis, Colesborne, Andoversford, R.S.O., Gloucestershire, writes:—"As I am endeavouring to raise a late-flowering race of Nerines which shall be equal in beauty to those which flower early, I should be much obliged if any of your readers who may have any good and distinct hybrids or species in flower during November would send me a freshly-cut truss of flowers by post. There are two species not in cultivation, as far as I know—N. Iucida, Herbert, Bot. Reg., t. 497, and N. marginata, Herbert, which some of your readers in the Cape Colony night be able to get, and which would be great acquisitions to the lovers of this beautiful genus."

GRAND YORKSHIRE GALA, FLORAL AND MUSICAL EXHIBITION. — Λ general meeting of guarantors and life members of the Grand-Yorkshire

Gala was held at Harker's Hotel, York, recently. Sir JOSEPH TERRY, J.P., presided, and there was a good attendance. The following resolution had been received from the Royal Horticultural Society :-'The Council of this Society, having heard from members of the deputation attending the York Gala of the great kindness and hospitality extended to them by the Lord MAYOR and Lady MAYORESS of York and by the chairman and committee of the Gala, wish to express to his lordship and the Lady MAYORESS and to all the members of the committee their very best thanks and sincere appreciation of the courtesy shown to their deputation." On the motion of Mr. Hodgson, seconded by Mr. Henry Scott, numerous grants were made to the local charities.

RHEA FIBRE.—Hitherto planters have found it difficult to compete with the Chinese in producing Rhea-ribbons and China-grass, the price of labour having hitherto proved a stumbling-block to profitable cultivation. The Chinese method is to strip the stems by hand, and with a ring of Bamboo on the finger they clean the strips of bark so effectively that it at the same time removes the greater portion of the gum. A machine designed to imitate this operation. and so enable the planter to put Rhea-ribbons on the market at a price considerably lower than the Chinese, even at their low-priced labour, has been manufactured by the Ramie Syndicate, Staines, Middlesex. The machine is portable, and can be worked by water, steam, horse, or bullock power. A great advantage is that it can be used on the field. It requires no skilled labour, a couple of boys can run it. It simply requires feeding; the stems are passed into the machine and returned as fibre, requiring only to be taken off and deposited on the dryingracks. When properly dried, there only remains to bale it up and ship it. It is asserted that it will pay the grower in India, West Indies, Australia, and other countries, such as Algeria, Egypt, Straits Settlements, Java, California, the Southern States of America, Mexico, Brazil, Argentine, Venezuela, &c. Where sugar and coffee do not pay, the land can grow Ramie, and once a continuous supply can be depended upon, mills will spring up, and the strong lustrous fibre will become a necessity. It will pay the planter abroad, it will pay the manufacturer here, who will only have one cause for complaint, and that will be that the goods made of Ramie last too long. In the meantime, the plant Bohmeria nivea can be grown in this country, as the following letter from Mr. McHattle shows :-

"We grow a small plantation for our own use. So far as I am able to judge, it would grow and pay for growing, say, in Kent. The frost often ents it down in spring; however, that does not seem to interfere much with its growth, for it comes up again in after weeks as strong as ever. I should say in the South of France two crops might be obtained in one season, and in India three crops, for it is a rapid-growing plant. I would not advise a large plantation; but I do think it worth trial in our best counties, and I shall be glad to assist anyone who is anyious to make a start.

John W. McHattle,

Gardener to his Grace the Duke of Wellington, Strathfieldsaye, Sept. 25, 1896."

BRUSSELS INTERNATIONAL EXHIBITION.—Mr. J. DREDGE, Executive Commissioner for the British Section of this Exhibition, states that considerable progress has been made by him in his work, and that the prospects of Great Britain being well represented in all departments are excellent, and applications for space are coming in well.

DOCK-LEAVES AS FOOD FOR PIGS.—Many of the pastures in the Bernese Oberland are so full of Dock and of Bistort that at this season there appears to be little else. Seeing the peasants cutting the leaves, and hanging them to dry under the caves of their châlets, a dreadful suspicion arose that this might be the basis of Swiss tobacco. An enquiry, however, elicited the fact that the leaves were dried for the benefit of the swine in the winter-time. Docks and Dock-leaves run to waste in this country, though the seeds contain abundance of starch; and, as we have seen, the Swiss have found a use for the leaves.

MICROBIC DISEASES OF PLANTS.—It is only fourteen years since M. HARTIC announced that there

were no microbic diseases of plants; and Anton de BARY, two years after, had already modified that decision by declaring them to be very rare, and explaining this rarity by the generally acid reaction of the vegetable tissues. Nevertheless, in 1885, ho mentioned four bacterial diseases of the Pear, Hyacinth, Wheat, and Potato. Ideas have somewhat changed now; the general acidity of plants is no longer admitted, and, further, there are bacteria which do well among acids. Mr. ERWIN F. SMITH gives a good epitemic of the state of the question in the American Naturalist (August and September), noting, according to the most authentic works, the bacterial diseases of plants actually known. He commences his investigation with the diseases of the Beetroot, one of which had been already described by Mr. E. KRAMER as being caused by a bacillus not yet specified; another has been described by J. C. ARTHUR and K, C. GOLDEN, and two others by M. BOLLEY and M. HILTNER. This work is only in its commencement, NEW YORK BOTANIC GARDEN.—A sum of 2500 dollars has been obtained as an endowment fund for this garden, and 250 acres of land set aside by These were so clear and precise, that the collector the municipality of New York. The herbarium and library of Colombia College are to be transferred to the new garden, of which Professor BRITTON is to take charge.

UROPEDIUM LINDENI. — An amusing story is told relating to the discovery of this plant in a recent number of the Journal des Orchidées. According to the story, as told by the late M. Funck, Linden, in the course of his wanderings in South America, entered a cavern, but had hardly done so when a gigantic bear rolled down from the rocks above, dragging with him a huge mass of the Orchid now known as Uropedium Lindeni. Struck with astonishment at the plant, Linden soon recovered his fright at the fall of the bear, which, fortunately for

words: "Although one has to get up rather early, still, I think that buying the flowers is the nicest part of the whole business; and though some people think Covent Garden is a rough place for women, I don't at all agree with them. The salesmen are so kind and helpful, and never try to take advantage of me-and I have lots of friends amongst the barrowmen. On the whole, I am struck with the kindliness and friendship of one's fellow-tradesmen; there seems to be a sort of creed amongst shopkeepers to help one another, which one doesn't find in all other walks of life." Mrs. Heron-Maxwell records that it is really difficult to buy for her sort of business, and that a wise choice can only be learnt by experience, and even then a certain amount of waste must be expected. It is very curious to note a kind of craze people get for one particular flower. Once learned, this particular plant can be ordered in quantities, and it is certain to be demanded for every kind of decoration. At present Chrysanthemums are the rage.

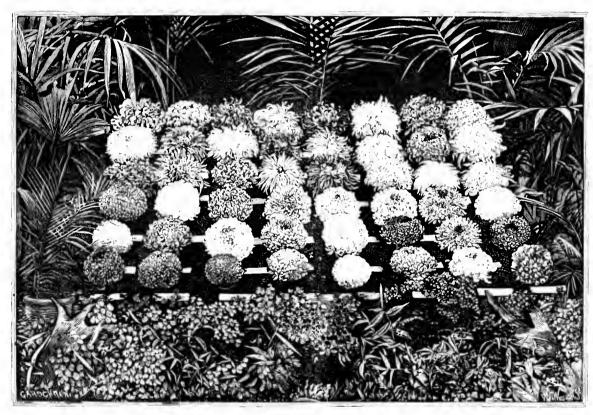

FIG. 101.—A GROUP OF JAPANLSE CHRYSANTHEMEMS.

and Mr. E. Smith renders a valuable service by collating the results already achieved in this branch of science. Revue Scientefique.

A ROYAL PURVEYOR OF ROSES.—Messrs, WM. PAUL & Son, of Waltham Cross, who already hold the appointment of Rose growers to the QUEEN, inform us that they have lately received commands to supply the plants for a new Rose-garden for H.R.H. the Prince of Wales at Sandringham.

HELIOPSIS SCABRA, LADHAMS'S VARIETY.—Recently some flowers of this variety, which had been fourteen days in water, but which were looking comparatively fresh-looking, were sent for our inspection by a correspondent. The plants had been flowering since July, and there was every appearance of their continuing to do so till cut down by frost. Its habit is said to be compact and neat, with the flowers arranged on long branching stems, making it a useful hardy plant. It originated in the Ladhams Nursery, Southampton.

him, retired growling fiercely. Some years after, LINDEN despatched FUNCK to South America to collect specimens of the Uropedium, giving FUNCK all the necessary particulars where to find the cavern, had no difficulty in finding the spot. Advancing carefully, rifle in hand, the collector narrated how he entered the cavern, there to meet with a bear seated on his haunches. The friendly bear extended his paw to greet the visitor, and said "Ah, Mr. FUNCK, and how is that dear fellow LINDEN! Has he recovered from the scare 1 caused him at the time of the discovery of Uropedium Linden!" The story is at least as true as some other narratives relating to the discovery of Orchids!

A LADY FLORIST. — Mrs. HERON-MAXWELL, according to the Daily Mail, is to be seen every morning at Covent Garden buying flowers for her dainty establishment in Lower Belgravo-street, London, S.W. Mrs. HERON-MAXWELL says she loves this department of the business. To use her own

THE CULTIVATION OF CYCLAMEN. -- MM. ALLY. HEBERT and GEORGES TRUFFAUT contribute to the Journal de la Societe Nationale d'Horticulture de France for August, a paper on "The Cultivation of Cyclamen," in which they say that:-1. Under the influence of manures, Cyclamens increase the total weight of vegetable matter elahorated, but this increase relates to the leaves, and diminishes the number of flowers proportionately, thus working for an effect contrary to that desired by the grower. 2. Successful cultivation of these plants can only be hoped for by working, as regards physics, on the soil in which they grow. This soil must, however, contain a sufficient proportion of elementary substances, In practice, the mixture of leaf-mould and sandyclay succeeds well. 3. If it is thought, owing to poorness of soil, necessary to add complementary manures, our analyses advise the use of a very dilute mixture of nitrate of soda, chloride of sodium, and sulphate of iron. 4. Increase of substances useful to Cyclamen, supplied artificially in superabundance, can yield no

improvement either to the beauty or the quantity of the flowers. Selection tends only to this end, and nutrition improper and in superabundance often modifies disadvantageously in a few months the hereditary characteristics peculiar to the race.

AGRICULTURAL RETURNS.—The Board of Agriculture has issued the customary statistical tables showing the acreage of crops and the number of live-stock in Great Britain in 1895 and 1896. The total number of acres under orchard cultivation in Great Britain in 1896 was 221,254, an increase of between 3,000 and 4,000 acres over the previous year. This increase is even more marked in the case of market-gardens, which in 1895 comprised 96,696 acres, as against 92,837 acres in 1895. Details of this kind are given for each agricultural crop, and each county.

CLEMATIS CRISPA, LINN.—This is a species native of the Southern United States, and but rarely seen here. For a flowering specimen we are indebted to Mr. Bursider. The lobes of the three-parted leaf are stalked and lanceolate; the flowers solitary, lilae, on long, slender stalks, 7 cent in diameter, apetalous, the sepals forming a cylindrical tube, each sepal oblong below, expanding into a broad ovate-acute or acuminate lilae-coloured blade, the margins of which are wavy or lobulate.

BOTANICAL LATIN GRAMMAR.—A correspondent asks whether there is not a grammar the illustrations and examples of which have a direct bearing on horticulture. Instead, he says, of "hammering away" at paciscor—I bargain; or numus—a coin; he would have "fodio—I dig"; Viola—a Vielet"; and so forth. We fear there is no such book. If our correspondent can secure a copy of Linnaus' Philosophia Botanica, it would help him greatly. Linnaus' descriptive language is admirable for its purpose. Would that modern botanists and directness.

THE SCOTTISH HORTICULTURAL ASSOCIA-TION.—An interesting and successful meeting of this association was held on Tuesday, November 3, at 3, St. Andrew Square, Edinburgh, Mr. R. W. E. MURRAY presiding. There was a large attendance of members, and twenty-four new names were added to the roll, among which we hear was the name of Mr. D. T. FISH. An essay on "Glass-structures" was contributed by Mr. John McIntere, Darlington, which excited lively interest. It was mentioned in connection with the forthcoming Chrysanthemum show, Nov. 19 to 21, that it was likely to prove the largest that has yet heen held in Edinburgh, inasmuch as the space in the Waverley Market had been more largely taken up than en any previous occasion. Few early Chrysanthemums have been altogether satisfactory this season, though great hopes are entertained that the Edinburgh show may prove the best of the season. Lord Provost McDonald is to preside at the opening of the show, and the opening ceremony will be performed by Sir Lewis Mclver, M.P., and Lady Mclver.

A BEAUTIFUL BERRIED BUSH.—Few persons having in them a love for the beautiful, and who have passed in daylight in front of Dr. TROUNCER'S residence at Surbiton, says the Surrey Comet of Oct. 24, 1896, but must of late have noticed the singularly striking mass of berries of a rich orange-searlet colour seen on shrubs of one kind growing in the garden, and projecting high above the outer walls. It is known botanically as Cratægus Pyracantha var. Lalandi. Commonly this plant is grown against walls and houses, being kept hard nailed in and pruned so that it becomes a semi-climber. When so seen berries are produced in great abundance, but the effect is usually formal.

WINCHESTER GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—The fifth annual meeting of the above association was held on Tuesday, Oct. 27. The secretary's report stated that the society was in a flourishing condition, they had a substantial balance in hand, and the number of ordinary members was a little over one hundred, and the honorary members

over forty; the average attendance during the year was fifty. Mr. Mayo, who had been chairman for three years in succession, resigned; and Mr. Munr, gardener to Mrs. Warner, was elected chairman. Mr. Neville, gardener to F. W. Flight, Esq., Twyford, was elected vice-chairman; Mr. Towns re-elected as honorary secretary. During the winter session, lectures will be given by Professors Gilchrist and Foulkes, under the auspices of the Hampshire County Council.

FLOWERS IN SEASON.—A very bright scarlet-coloured, very fragrant Carnation, named Yule Tide, reaches us from that veteran florist, Mr. John Forbes, of Hawick, N.B., who tell us in the note accompanying it that the plant has received six First-class Certificates this year. As a flower cut from a plant, which the sender remarks has been in continuous flower for a period of thirteen months, it is remarkable for size and substance. As a winter-flowering Carnation it will run Winter Cheer and some other favourites hard for a place in public favour.

THE FRENCH VINTAGE.—Reports from the Western Departments of France are stated to record an unfortunate condition of things, the long-continued rains having played sad havoc in the vineyards. The weather is answerable for many a dreary outlook in vineyards within 20 miles of Paris. Last year we briefly drew attention to the fact, on the authority of a consular agent on leave of absence, that Hops—and beer—were making way where the Vine had failed. This, for the sake of the workers, is to be regretted—in this connection doubly so.

THE WEST OF ENGLAND CHRYSANTHEMUM SOCIETY'S fifth annual exhibition will take place on November 10 and 11, in Plymouth Guildhall. The committee are making strenuous efforts to secure a record, and to that end are introducing novelties of various kinds. Mr. F. C. SMALE, of Torquay, has been engaged to lecture on both evenings on "The Chrysanthemum at Home and Abroal," with special limelight illustrations. The National Chrysanthemum Society's jubileo medal will be awarded to the best bank of Chrysanthemums in the hall, and no doubt this will lead to even keener competition than last year. As an inducement to further subscriptions, the committee have decided to admit to the lecture all subscribers free of charge.

PRESENTATION TO MESSRS. BACKHOUSE & SON, YORK.—An interesting ecremony took place on Thursday afternoon, Oct. 29, at Messrs, Backnouse & Son's nursery, near York, when a deputation of the Ancient Society of York Florists waited upon Messrs. BACKHOUSE to present to them a Gold Medal and address as an acknowledgment of their generous assistance to the society in sending collections of plants, flowers, and fruits for complimentary exhibition at the summer shows of the society. The deputation consisted of Mr. Geo. Lamb, treasurer; Mr. J. Lazenby, secretary; Mr. J. E. Wilkinson, and Mr. John Pillmoor, stewards; Mr. Councillor Staines, Mr. R. Mackintosh, and Mr. E. Everard. Mr. J. E. Wilkinson, as senior steward, made the presentation, and addressing Mr. James Backhouse, by whom the deputation was received, said they were deputed by the subscribers to the Ancient Society of York Florists to wait upon the firm with the object of presenting to them a token of the appreciation which they felt of the kindness of Messrs, Backhouse & Son in contributing so generously to the shows which were held during the summer under the auspices of the Florists' Society. They appeared there as representatives of the subscribers of the society, who were desirous of expressing their indebtedness to Messrs. Backhouse for the valuable help which they had rendered to their various shows, and for the disinterested support which they had accorded to the society. He also took the opportunity of testifying to the very great and opportune assistance they received from Messrs. Backhouse, who gave them very valuable support when the Chrysanthemum Show was projected some seventeen years ago. Hence the errand of the deputation, Mr. Wilkinson then handed to Mr. Backhouse a massive and handsome gold medal with appropriate design and inscription, and also read a short address, which he said would be illuminated and framed and presented later on. Mr. James Backhouse, in replying, said what assistance the firm had been able to give had been very willingly rendered, and he hoped that in the future the firm which he then represented would be able to still further the interests of the Society. He thanked them sincerely for the token which they had presented to his firm of their good will. He then invited the deputation to make a tour of the extensive ranges of glass-houses, in which are fine collections of Orchids, Ferns, and plants in great variety.

SIXTY-EIGHT CHERRIES IN A BUNCH.—In the tartenfora for October 15 is a photographic illustration of a bunch, consisting of sixty-eight Cherries, all springing from a common stalk. The bunch is preserved in the museum of the Agricultural high-school of Berlin.

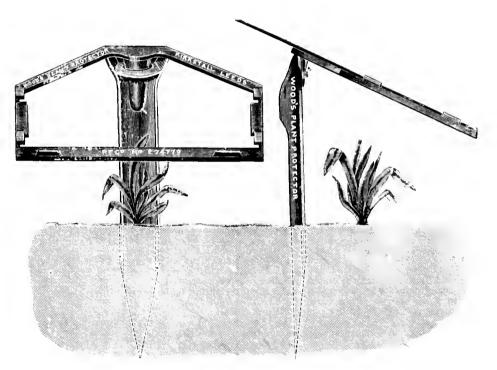

THE FRUIT CROP IN THE UNITED STATES.—The fruit harvest, says the Echo, has been enormous in certain districts of America this year. In the Chatauqua region Grapes are so abundant that the price offered barely covers cost of transport, and the greater portion of the Apple crop in places distant from market centres has been left to ret on the ground, or is utilised as food for pigs. It is to be hoped that improved methods of preservation will be introduced whereby excess produce may be kept until a time when the demand is such as to enable it to be sold at a prefit.

NEW PUBLICATIONS. - A Book about Roses, by S. REYNOLDS HOLE, Dean of Rochester, fifteenth edition (EDWARD ARNOLD), contains a list of the best exhibition and garden Roses. A view of a Rosehedge in the Deanery garden, and sundry other illustrations, are new features in this most popular volume, which retains its freshness even in a fifteenth edition .- Year-Book of the United States Department of Agriculture (1896), contains a number of articles on the application of science to practice which are of the greatest interest to cultivators; an excellent index renders them readily accessible. - Report of Work of the Agricultural Experiment Stations of the University of California, 1896, is full of valuable information on soils, water, fertilisers, fruit growing, plant-diseases and like matter. The botanic garden of the University at Berkeley is under the charge of Mr. J. BURTT DAVY. The introduction of the Australian Salt-bush, Atriplex semibaceatum, will, it is said, render productive vast tracts of land which are at present a blot on the landscape. It will also prove of great profit to owners whose farms are marked by alkali spots which have resisted orchard or pasture extension. By means of the Salt-bush, these spots can be covered with verdure, and the resulting forage will aid greatly in maintaining domestic animals. Sachalin has not justified the expectations formed of it. The Foothill Culture Station near Jackson till lately under the charge of our correspondent, Mr. Hansen, who has studied the vegetation of the district, enninerating 800 species as growing in Amador County, and among them a large number of species of Oaks .-An Encyclopadia of Gardening. By T. W. SANDERS. (COLLINGRIDGE.) A second edition of this useful little book has appeared; its aim is eminently practical- to give in the smallest compass, and with the least expenditure of words, the principal details relating to garden plants which an amateur is likely to want. Mr. SANDERS has condensed into less than 500 pages details which the reader without such help might have to consult numerous volumes. Sometimes brevity leads to obscurity; thus, under Achillea, we find "Int. (foreign species) 1596." We suppose one particular species was introduced in the year 1596, but it is not specified, and there are not 1596 species of Achillea.—Hesdörffers Monatshefte für Blumen und Garten Freunde. (Berlin: Robert Offenheim.) This is the first number of a new periodical devoted to amateur gardening, and illustrated with coloured plates and other illustrations. The contents are varied and interesting. - Dictionnaire Pratique d'Horticulture et de Jardinage, par G. Nicholson, traduit par S. MOTTET (Paris: OCTAVE DOIN), has now reached the end of the letter P. It is needless to reiterate here our appreciation of this useful book .- The last number of the Boletim da Sociedade Broteriana, published at Coimbra, contains, amongst other things, a classification of the species of Querens according to the anatomical structure of the petiole. Professor HENRIQUES continues his contributions to the Flora of Portugal. The professor enumerates three species of Pinus, two of Cupressus, four of Juniperus, and one of Taxus, as natives of Portugal.-Die Tierparasitären Krankheiten der Pflanzen. Von Dr. A. B. Faank. (Breslau: Trewendt.) A second edition of a useful book on the diseases and deformities of plants caused by insect and other animal agencies. It is a book we often have occasion to refer to as containing detailed lists of the insects and other creatures injurious to plants, -Some New South Wales Plants worth Cultirating for Shade and other Purposes. By J. 11. MAIDEN. The title explains the object of this publication. We have often urged our colonial friends to endeavour to develop their own resources rather

and Practice of Dairy Work. Translated from the German of W. Fleischmann by C. M. Aikman and R. PATRICK WRIGHT. (BLACKIE & Co.) This is not a book which we can review at length in these columns. It must suffice to say that it is a standard book of great excellence, and one which, in view of the great foreign competition to which they are subjected, British, and especially Irish, dairy-farmers should make themselves acquainted with. - A merican Grape-Growing and Wine-Making. By George Husmann. Fourth edition. (New York: Orange JUDD COMPANY.) A very complete manual, which will be serviceable in those of our colonies where the Vine is cultivated in the open air. Full directions are given for making wine. The author writes in such a cheery, wholesome spirit that he impresses his readers, and will, no doubt, infinence them for good.

PLANT PORTRAITS.

F.G. 102,-WOOD'S PLANT PROTECTOR.

than sequaciously imitate our Chr, santhemum and other similar culture. How vastly more interesting would be a good collection of the plants mentioned in Mr. Maiden's list.—Fleurs et Oiseaux, Revue Illustrie d'Ornithologie et d'Horticulture. A publication issued by M. E. DE WAEL, of Boulevard de la Senne, Bruxelles, and devoted to birds and flowers. - The Nursery Book. The second title of this book will remove any misconception that might arise as to its object; it runs thus:—"A complete guide to the multiplication of plants." It is, in fact, a third edition of a book by Professor BAILEY, and is published by Messrs. MACMILLAN. The author incidentally mentions the subject of grafting, and shows that the prejudice against it is due rather to improper or faulty grafting than to anything necessarily in-jurious in the process itself. The first five chapters are devoted to general considerations connected with propagation, the sixth to the special means requisite in the case of individual genera; this portion of the book is alphabetical. A glossary and an index complete a book which should be in every garden library. The Book of the Dairy A Manual of the Science

NEW INVENTION.

WOOD'S PLANT PROTECTOR.

THE frame shown in fig. 102, bas been devised by Mr. J. Wood, Kirkstall, near Leeds, with a view to supplying a suitable means for the convenient protection of many plants and bulbs that are not absolutely hardy, and especially such as are injured more by the excess of wet than cold during the autumn and winter months. It is made of cast-iron, in two pieces, which are capable of being locked together by a strong pin and socket. The metal is angled, and the castings have been "barffed" by a patent method to prevent them from rust. The stout upright is 2 inches wide, and 13 inches long. The frame is 113 by 115 inches and by means of a pin is dropped into the socket of the upright, when it becomes ready to receive the sheet of glass, for which convenient grooves are provided. The glass sheets used are 18 inches by 11 inches, or 13 inches by 11 inches.

The object of the inventor has been to produce a protector of durability, and capable of being fixed in a moment.

NOTICES OF BOOKS.

HOW TO STUDY WILD FLOWERS. By the Rev. George Henslow, &c. The Religious Tract Society).

This is a little book as full of information as, to use a common phrase, an egg is of meat. It is intended, us the title page tell us, for the use of schools and private students. The student is presumed to wish · to know something about our wild flowers, but he does not quite know how to begin to study them. To show how he may be able to do this without other assistance is the aim of the present book." The book is thus intended expressly for the novice. The directions and the information given are, it need hardly be said, excellent. Our only fear is that the beginner may be alarmed and deterred at the outset. At any rate we think it may be well if he refrain from reading the preface till he has made some little progress with the examination of the flowers. Beginners require to have what to them are new phenomena, and specially new ideas, placed before them sparingly and gradually. When they have mastered a few elementary facts and digested a few leading principles, a stronger dose may be given, but at first it seems best to be content with small portions frequently repeated. This method of giving mental nutriment is, it is true, not easily carried out by such accomplished teachers as the author of this book. There is with many toachers a tendency to tell all they know at once, and to condense into a small number of pages an amount of information that might well be spread over a very much larger space. A few carefully selected illustrations leading up from the simple or conspicuous to the more complex and less easily recognised forms seems preferable. A multiplicity of examples necessitates a number of contractions and floral formulas which may prove embarrassing to the beginner, but the study of which, we may assure him, he will find fascinating as he goes on. One excellent feature in the present book is the manner in which the author keeps before the mind of the reader the significance of the facts and phenomena he brings under his notice. The "reason why" is constantly kept in view, and the appearances and phenomena presented by plants are co-related with the conditions under which plants exist, and with their actual requirements. In like manner, the relationships between plant and plant and the evidences of a common ancestry, more or less remote as the case may be, are carefully pointed out. Mr. Henslow appropriately takes many of his illustrations from the experiences and practices of the florist. "If we ask how it is that insect-visited flowers are generally more conspicuous and less fertile in Nature than the insignificant self-fertilisers, the answer resides in the fact that intercrossing is a temporary stimu-

lating process, and tends to make the plants

raised from their seed finer plants in the popular sense of the term. For florists find that when they cross their flowers, those on the seedlings raised from them are often larger and more variously coloured, and the foliage may also be "improved," while even a large number of seeds may at first be produced, but all this tends to detract from the reproductive energy, and soon reduces the degree of fertility; so that florists find that after having crossed and re-crossed a plant with the view of "improving" it more and more, i.e., in a floricultural sense, they soon get to the end of their tether: the "best" flowers at last fail to produce much or even any good seed, and they have to start afresh on some new line." Mr. Henslow's illustration of the abundance of flower in a particular Dendrobium as contrasted with the paucity of seed-vessels, loses some of its force by the consideration of the vast numbers of seeds produced in one pod. Self-fertilisation in plants is not considered by Mr. Henslow to be injurious, and there is no doubt from Mr. Henslow's previous observations and researches that too much importance has been attached to the alleged injurious effects of self-fertilisation. Whether the advantage, which must be admitted, of an occasional cross, has been similarly over-estimated remains to be seen. Mr. Henslow's book is illustrated with woodcuts illustrative of the structural features detailed in the text. For the sake of the next edition we point out that fig. 37, p. 156, more nearly represents Gentiana acaulis than G. pneumonanthe.

The work is one eminently suited for the thoughtful and patient student, and it is one well calculated to stimulate research and to promote a real knowledge of botany.

THE ORCHIDS OF BURMA,*

Too great praise cannot be bestowed on such patient workers in the botany of any district as Captain Bartle Grant, of the Border Regiment, Adjutant Rangoon Volunteer Rifles, has bestowed on the elever compilation under notice, and in which the Orchids of Burma are brought together in a handy volume; described, remarked upon, and their references given, the whole constituting the most complete and accurate work on the subject, available for the identification of species, or for the use of the student who is anxious to go over the ground already opened up and rendered easy by the steady, plodding labours of Captain Bartle Grant, whose reasons for undertaking the work, as given in the preface, at once suggests the usefulness of his finished work to all who have cause to consult its pages. Captain Grant says, When I commenced the study of Burmese Orchids. I found the want of a book of reference at a moderate price, suitable for a beginner's use, a serious obstacle to my progress." And to provide for the want which no one was better able to estimate than himself, he commenced the long and ardnous task which he has so well completed. The Orchids of the Andaman Islands are also included with those of Burma, and both localities have been largely drawn on by importers for some of the most beautiful Orchids in cultivation, such as Dendrobium Wardianum, Vanda cœrulea, V. Amesiana, and V. Kimballiana; but a study of Captain Grant's work reveals the same story that perusal of any complete enumeration of the local flora of any tropical country reveals, viz., that for every species now grown in gardens, there are a dozen equally pretty and interesting yet to be got over-not of the showiest, perhaps, but still good garden plants. To those interested in Burmese Orchids, either in India or elsewhere, Captain Grant's work, which is to be obtained through Bernard Quaritch, 15, Piecadilly, London, will be of inestimable service.

How Much He Thought He could Earn.—Presiding at the annual meeting of the Yeavil and District Gardeners' Association on Friday, Judge Pullbrick, Q.C., F.R.H.S., in the course of his opening remarks, said he had often thought, and sometimes said, that if the worst came to the worst, he could earn 2s. a day at propagating.

HOME CORRESPONDENCE.

THE AUSTRIAN BRIAR.—The "Austrian Briar," or "Harrisoni," Rose, usually flowers but ence in a season. Last year, however, three plants of this variety flowered during August and September, and we propagated from them, with the result that all are now (Oct. 19th) in full bloom. Frank Cant & Co., Colchester. [With this communication we received a glorious bunch of this highly fragrant and distinct Rose. We congratulate Messrs. Cant on this important "find." Ed.]

SCHUBERTIA GRAVEOLENS.-1 often wonder why this grand stove climber is not more generally grown. For cut flowers it is almost invaluable, for the long succession of blooms which can be obtained from a freely-grown plant for quite six months. At Easton Park, near Grantham, there is a plant trained on the roof of one of the stoves, which has produced a great quantity of its pure white waxlike, sweet-scented flowers ever since May this year, and will continue to flower for some time longer. Most of the trusses on this plant consisted of from six to nine flowers, and the flowers are much larger than those of Stephanotis grandiflora, which they very much resemble. Another grand old plant, contrasting well with the above in the colour of its flowers, is Ipomoea Horsfalliæ, a plant of which is doing equally well under Mr. Watson's care at Easton, and showing many trusses of its deep rose coloured flowers. The plant looks likely to flower the winter through.

CELEBRATION OF THE SIXTIETH YEAR OF HER MAJESTY'S REIGN.—As numerous suggestions are under consideration for celebrating the sixtieth year of Her Majesty's beneficent reign, may I venture to bring before the British people a long felt need of the horticultural community? Horticulturists have no common meeting place, no centre, and the estab-lishment of a Home of Horticulture—a Royal Home of Horticulture, if Her Majesty graciously appointed it so-would be an event worthy of this period of our national history. It is quite unnecessary to emphasise the inconveniences inseparable from flower and other similar shows held in buildings not structurally adapted for them, and to do more than refer to the undesirability of holding exhibitions in places to which any exception can be taken. Our institute would be above any objectionable connections. would suggest the establishment of a Home of Horticulture which should be so designed as to afford facilities for further promoting the interests of other arts, painting, music, &c. It is generally admitted that the best pictures are not always received at the Academy; here they would find a welcome home. On behalf of music, the overflowing non professional talent might here find ample opportunities for development, even for the assistance of philanthropic enterprises; such a trio might be advantageously united to their mutual benefit, and to the improvement, enjoyment, and advancement of everyone. Having worked out this project somewhat in detail I beg to invite co-operation towards its attainment. The aim is to bring together all horticultural interests to a metropolitan home, presided over by life governors, qualified in the first instance by donation. Every gardener would be eligible for election to the position of life governor whenever a vacancy occurred, the qualification fee being only required from the first board of governors for defraying expenses in the initiatory stage of the society. Suitable premises being found, and furnished in every parti-cular with due regard to the intention and requirements of the establishment, arrangements would be made for a continuous session of exhibitions, lectures, concerts, &c., and an annual convention would be held perhaps in May to consider the year's work, &c. For the convenience of visitors, a properly conducted buffet, with reception and reading rooms, would form part of the scheme, also a library of books of referbe made available.] We all know and appreciate the refining influence of beautiful flowers, hence the home to house such in our great metropolis might do a great deal to counteract the degrading influences of music-halls, &c. Let us hope that another Joseph Paxton will come forth and crect a Crystal Palace in one of our ceutral London parks as a home of horticuture for Great Britain. James L. Wood, F.R.H.S., Cranbrook, Oakleigh Park, Whetstone.

STRAWBERRIES IN NOVEMBER.—I have sent you a few Strawberries picked from an open border facing

south, and have many more in bloom, showing the mitdness of the weather. The variety is Vicomtesse H. du Thury. W. Lewis, gr., East Sutton Park, Staple-burst Kent.

hurst, Kent. MICHAELMAS DAISIES .- Of all the late outdoor autumu flowers, none can compare with the Michaelmas Daisies, Starworts, or perennial Asters. After more than a mouth of rough weather, including frost of 6°, which blackened and destroyed almost every other outdoor flower, several varieties of the Michaelmas Daisy looked very little the worse. When this is taken into consideration, it is a matter for wonder that these plants are not more planted, although they are beginning to be generally recognised as valuable flowers for the flower garden and herbaceons borders. Where much house decoration is required, what is there at this season so well adapted for filling large vases as the beautiful branching sprays of such Michaelmas Daisies as Ericoides, Robert Parker, Paniculatus, W. J. Grant, Cordifolius, Diana, and others. They are of easy culture iu any moderately good soil, as well as in the semi-wild garden, and on the rockery the very dwarf species may be planted; while in positions where the tall-growing varieties can be grown in masses they are very effective. It is in September and throughout October that they are generally most serviceable, especially when other outdoor flowering-plauts have their flowers spoiled by frost; those which flower at this time should be planted in larger numbers than the earlier-flowering. Here, in South Bucks, as elsewhere, the past summer was very trying for these plants, although when the rain came, towards the end of August, a wonderful change soon took place in the plants, and growth from this time was all that could be wished for, although finer weather would have been acceptable at the flowering One of the best early flowering varieties is period. A. Amellus bessarabicus or Amellus major, as I have it there is no difference. It begins to flower rather too early, but it has wonderful lasting properties, the flowering period generally extending into October, and for furnishing armfuls of flowers for house decoration or harvest festivals, it is one of the best, and its masses of dark violet flowers are very effective in the herbaceous horder. The plant averages 2 feet in height. Arcturus is a very distinct dark purple variety, 3 to 4 feet high. Of pink-flowered forms lavigatus is a little gem, of compact growth and dwarf habit, averaging not more than 21 feet in height. Perhaps the best of all as regards colour, which is a beautiful pale blue, is Nancy, which flowers towards the end of September, height 3 feet. Cordifelius albutus, C. Diana, and Paniculatus W. J. Grant are still flowering (October 23); they produce graceful sprays of pale blue or lavender flowers, very useful for cutting, the latter variety branching to the ground, height 4 feet. Robert Parker, growing 5 to 6 feet in height, with larger flowers of soft lavender-blue, is a beautiful variety, the plant lasting in bloom until near the end of October. Archer Hind is another late-flowering variety, still good, with panicles of soft blue flowers; and Maia, also now in flower, is of a darker shade than the preceding. Novæ Anglie reseus and N. A. pulchellus are taller varieties, distinct in colour, rose and violet. I have as yet omitted the white-flowered varieties, some of which are extremely beautiful, and in some respects of more value as cut flowers than the violet, blue or purple varieties. Perhaps the best of the September-flowering Asters is A. Belgica Harpur-Crewe, which grows to 5 or more feet in height, and branches freely; flowers white with yellow eye. Purity, growing about the same height, is rather later, the flowers are pure white, very good. Janus, white, 4 to 5 ft.; flowers still open. John Wood is another fine white, of dwarfer habit; Versicolor Themis is a good dwarf variety, 2 feet to 3 feet; Esme is the best dwarf white variety (11 foot), with large white flowers, some still open; this was one of the Rev. C. Wolley Dod's seedlings, and through his courtesy the writer is enabled to grow this charming variety. A small flowering, but extremely useful variety for cutting, is Ericoides (2 to 3 feet), a great favourite for vasework. The same may be said of Tradescantii, the first flowers of which are opening now; the sprays are very graceful, and the foliage being small, lanceolate, of a deep green colour, giving it a very light appearance—this grows 4 to 5 feet in height. In the above will be found a good selection from the now numerous varieties catalogued. Twelve good ones, arranged as nearly as possible according to the flowering-season, are:—Amellus bessarabicus, Harpur Crewe, Levigatus, Nancy, Purity, Esme, cordifolius, Diana, Robt. Parker, paniculatus, W. J. Grant, N. Angliæ roseus, ericeides, Tradescantii; all may be

^{*} The Orchels of Barma (owlinding those of the Andaman Islands), by Captain Bartle Grant. Rangoon, 1895.

easily increased by division. A very good plan is to pot up a few suckers of each variety, which are plentiful about this time, and winter in cold frames, or plunge them outside, to be planted out in spring. The later varieties are very useful grown in pots for conservatory decoration. II.

THE SECOND FLOWERING OF CHOISYA TERNATA.—Seeing Mr. Baxter's note on the second flowering of Choisya ternata this season, I may be allowed to state that, in the gardens which I have just left, Embley Park, Romsey, there is a large plant of it in full flower at the present time. I may also say that silicate manure is good for it, a fact which I discovered by its being planted close to a Vine, to which this sort of manure was applied; and some of the Choisya roots got into the Vine-border, with the result that its growth was much influenced for the better, and its flowering extremely fine. The plant was not protected during severe wintery weather, and did not suffer more than some of the Laurels and Rhodedendrons, which shows that it is a fairly hardy plant. John Champion, Hascombe, Godalming.

THE PLANTING OF PEACHES AND NECTARINES. -The substitution of young trees for old ones is a matter that ought to be provided for a few seasons in advance, so that when the time arrives for grubbing out the old trees, a number of fine trees may be found on the walls wherewith the fruit-wall may be kept replenished. If these young specimens are lifted at this date, and the work is well and carefully done, fruit is produced the first season afterwards. The practice of planting maidens of the Peach, Plum, Uherry, Pear, Apple, &c., on vacant parts of the fruitwalls and espalier fences is a good one, that no gardener should neglect, as in a very few years these trees, with proper care in pruning and training, become useful in filling gaps almost at once. I have just lifted and re-planted three such young specimens, which have been trained for placing in forcing-houses, the varieties being a Pine-apple Nectarine, Goshawk and Late Admirable Peaches. These trees were seand Late Admirable Peaches. lected three years ago, and on being lifted were found te possess an immense number of fibreus roots, just the kind one likes to see in a fruit-tree which is expected to yield fruit the first year. These trees will suffer scarcely any check from the transplantation. In planting in light soil in the warmer parts of the country, heavy loamy soil should be mixed with the staple, adding besides this plenty of lime rubbish, burnt earth, bones, or failing the latter, some rotted manure. I always firmly ram the soil when filling the holes if it he io a moderately dry state at the time. The best Peaches and Plums, also Cherries, which have grown at Merewerth, are planted in good soil, which was rammed a good deal at the time of planting the trees. Under this sort of treatment the shoots made are short and sturdy, and fruit-buds always numerous. Those planted under glass are treated in the same manner, and with the best results. Opinions vary as regards varieties to plant, and for mid-Vary as regards varieties to plant, and for independent season Peaches I fancy there is none better than Dymond, Royal George, Noblesse, and Stirling Castle. As an early variety Waterloo always does well at Mereworth; Bellegarde is excellent under glass, but does not produce its shoots quite so freely as some others, so that very careful attention is needed when disbudding. I planted two years ago an early Grosse Mignonne, but as yet I do not feel well satisfied with its behaviour, and its place will prohably be taken by Hale's Early. It would be in-teresting to hear the experiences of others concerning Early Grosse Mignonne. H. Markham, Mereworth Custle.

THE FLOWERING OF BAMBOOS. -- Bamboos generally flower rarely, and are supposed to perish immediately after flowering. There are, however, several authenticated exceptions to this rule, Arundinaria Simoni flowering annually at Kew and elsewhere; Thamnocalamus Falconeri, often called Bambusa falcata, also flowers frequently in the temperate-house at Kew, and does not suffer in consequence. This species has been known to flower simultaneously all over large areas, and to die immediately afterwards. The Kew plant was, therefore, considered to be abnormal. I have, however, lately seen in the "Kibble" Conservatory at Glasgow several plants bearing a few flower-culms, and I was assured by Mr. Dewar that it is of annual occurrence there. In the large conservatory at Chatsworth I saw lately a large specimen of Bambusa arundinacea bearing a few flower-branches, and Mr. Chester said he had seen the same plant in flower several times, and looked upon it as a usual thing for the plant to do so. Specimens of this plant were sent to the Kew Her-

barium, where the name has been verified. We have, therefore, three species of monocarpic Bamboos proving polycarpic under cultivation in this country. Is it possible that the effect of artificial conditions for a long period has been to modify the habit of these three species in the production of flowers intermittently, or does the same thing happen in the case of wild plants, and escape notice owing to the dense leafage of the barren stems? W. Il'.

THE LAST FLOWERS OF AUTUMN .-- Notwithstanding the extreme lateness of the season, I have two Oriental Lilies-speciosum Krietzeri and S. resenm, still in bloom in my garden. I had auratum flowering as late as October 16, with twenty-five flowers fully expanded, and quite fragrant at that time; but the speciosums I have mentioned, and which are characterised by great hardiness of nature, are later still. This species is invariably the last of my Lilies to bloom; and for this reason it is all the more highly prized. Roses have as yet been little affected by the influence of the frost (of which we have had in the south west of Scotland many degrees for several nights past), and many beautiful varieties, such as Mrs. Sharman Crawford, Mrs. John Laing, Merveille de Lyon, Mr. Cranston's Crimson Bedder, Marie Van Houtte, and Duchess of Bedford are flowering still. So also are the garden Chrysanthemums, which have never ceased blooming since the beginning of July, their season being much longer than usual this year. This is all the more remarkable, because the heavy rains and storms which recently prevailed were exceedingly unfavourable to floral productiveness, and to what is usually termed "perpetuality." There can be no question that during that exceptionally trying period myriads of flower-buds of every description were totally destroyed. I sincerely trust that my Rose trees may soon be quite dormant; very exuberant vegetation at this season is dangerous, and should be as much as possible repressed. David R. Williamson.

CYCLAMEN BUDS REFUSING TO OPEN.—Your correspondent who signs bimself "C. B. W.,"does not mention the use of manures to his plants, now that they should be about to develop their blossems. My plants are full of flower-buds, and I am applying some weak liquid-mannre water from the farm-yard. Our plants growing in the same temperature, and the same kind of house as "C. B. W.'s," and I have never had any Cyclamens which did not open their flowers satisfactorily. If. B.

Replying to "C. B. W.'s" question as to the reasen of white Cyclamen buds not opening, we think this is due to their being grown in 64° of heat on inverted pots without saucers; a het, dry atmosphere for Cyclamens at flowering time is hable to cause this. We believe that if "C. B. W." will water liberally, and place saucers under the pots, the buds will open freely. The best staging for Cyclamens at this time is a close stage, covered with ashes. Satton & Sons.

CHRYSANTHEMUM BEAUTY OF TEIGNMOUTH. -What a muddle seems to be made of this beautiful variety! With your permission I would like to give its history .- In 1894, Messrs, Hannaford & Sou, of Teignmouth, received from a relative in Australia a hatch of seedlings. Some of these were placed in the hands of Mr. George Foster, of Teignmouth, to grow, among them being two varieties named Beauty of Teignmouth and Pride of Madford. Upon trial the first-named was found to be a good thing; the other a dull red of small size, and it was discarded. Some fine blooms of Beauty of Teignmouth were placed before the Floral Committee of the National Chrysanthemum Society in the autumn of that year, but were unnoticed mainly owing to the fact that the room in which the Floral Committee sat was a very dark one, where anything coloured could not be distinguished. For the same reason, at the Devon and Exeter show, Mr. Foster was disqualified for exhibiting Beauty of Teignmenth in a splendid stand of thirty-six blooms. The judges, one of which is known all over England, considered it identical with Duke of York, which was already in the stand, and I admit Beauty of Teignmouth can be grown from the early bud to be hardly distinguished from Duke of York, and such was the case in this instance. However, this disqualification was one means of bringing Beauty of Teigumouth into notice. In October of 1895, the Royal Horticultural Society gave an Award of Merit to Pride of Madford, and a formight later to Beauty of Teignmouth, which, as certificated, is one and the same thing. In the same season I placed a couple of good blooms of Beauty of Teignmouth before the National Chrysanthemam

Society, which were passed. Last week this as Pride of Madford was certificated by the National Chrysanthemum Society, which in the last issue of the Gardeners' Chronicle is given as Pride of Madford, an American. It seems hard to get the merits of Beauty of Teigmmouth acknowledged. W. J. Godfrey.

AUTUMN TINTS.—Although the autumn has been extremely wet, and high winds have prevailed at times, some trees and shrubs at Dropmore have assumed very beautiful colours, although not quite comparable to those of last year. Up to the time of writing (Oct. 16th) not sufficient frost has occurred to injure either flowers or foliage here, and many trees and shrubs are very conspicuous in the woods and shrubberies by their richly coloured foliage. Of shrubs, none can compare with the richly coloured leaves of the Ghent Azaleas of dazzling crimson, red, bronze, and gold, which for house decoration, associated with white or other suitable coloured flowers, are effective and useful. While noting these it may be interesting to remark that those with pink, crimson, red and other highly-coloured flowers usually have the least colour in their autumn foliage, which often dies off of a dull reddish brown or greenish brown tint, while the highest coloured foliage is found almost exclusively on bushes whose flowers are of a yellow or orange colour. These are usually highly coloured even when growing in partial shade, although exceptions occur occasionally in these, as semetimes I have found a single stemmed plant among a batch of seedlings with dull brown foliage growing in the middle of others highly coloured, and under similar conditions as regards growth and light. The Venetian Sumach, Rhus Cotinus, is a very showy subject, with crimson foliage [In some soils and places this is a soft yellow. The single - flowered Viburnum Opulus is handsome, with both crimson foliage and berries also. One of the finest pieces of colour just no vamong trees is seen in a densely leaved specimen of Pyrus torminalis, branched to the ground, and about 50 r more feet in height. This tree appears even more vivid in its colouring than was the case last year, the leases being a beautiful bronzy red colour. This species of Pyrus is always a feature in the autumn, as the foliage invariably has high colours, although in some seasons the colouring is higher than in others, but never have I seen it more so than this year. Quercus coccinea, the Scarlet Oak, is also finely coloured now; this tree is well known for the handsome colouring of the foliage in the autumn. Maples have suffered much from the severe storms of wind and rain, for although the foliage of many attained a erimson and gold colour, the leaves were soon stripped off by the rough winds, and the trees are now quite leafless. The wild Cherries, "Geans," form a pleasant feature in the wools and pleasure-grounds dotted among other trees. Besides being handsome pillars of white blossoms in spring, they are also the first among woodland trees to assume the crimson tinted foliage in early autumn: these have also suffered from the rough weather, but to a lesser extent than the preceding, the leaves honging on the shoots very persistently. The Chestnut and Beech woods are rich in yellow and bronze; and our lurge trees of Magnolia acuminata are handsome, partly owing to the size of their leaves, the colour of which has now assumed a beautiful golden brown. Common Birch is b-autifully clad with yellow leaves. while the deciduous Cypress is a pyramidal picture of brown and yellow foliage. C. Herrin, Dropmore.

NARCISSUS HORSFIELDI FAILING.—A correspondent writing over the signature "Calyx," inquires in the Gardeners' Chronicle, p. 435, concerning a failure of the bulbs of Narcissus Horsfieldi. Speaking from an experience of well nigh twenty years I may say unhesitatingly that N. Horsfield, is not addicted to the particular kind of malady known to gardeners as basal rot:" indeed, so far from being general in this variety, it is the reverse, as in all my experience I have never had an instance of it. Judged by the general behaviour of this variety, it cannot be called a bulb of very vigorous growth, although it is one of the most prolific in reproduction by means of off-sets. In cultivating N. Horsfieldt an over rich soil is not wanted to render it prolific, and it is particularly so when left in the soil for say three or four years. It will then, in either light or heavy soils, assuming always the latter are fairly well dramed, surpass the bulk of the trumpet Daffodils. Dutch grown bulbs. however, while somewhat larger than those grown in England, frequently consist of very soft tissue, the result of being overfed, and the result is well known to all cultivators of the flower. In fact, this gross feeding is as unnatural as it is unnecessary, and is not

adopted by the best growers for the reason given by your correspondent, viz. "when basal rot starts in bulbs of this nature it would quickly develop. Moreover, it is not those over-large bulbs which produce the largest flowers, but rather those that combine size, firmness and solidity. When it is necessary to manure these bulbs, it is best to put the manure slx inches or further below the base of the bulbs, and not to dig it in indiscriminately before planting. And those who require the best value for money would be consulting their interests by dealing with an English firm of repute, making a stipulation for home-grown bulbs. Such as these may be planted in any good and deeply-worked ordinary soil without manure of any kind. Indeed, if "Calyx" adopts this view, and the above suggestions also, he will find that this variety is as strong and sound in constitution as Allowing the bulbs to remain in one spot for three years is one of the best preventatives to over-manured soils, though commercially this is scarcely possible. E. Jenkins.

EFFECTS OF THE LATE RAINS. - Those who take the trouble to note down from time to time the progress of the various Kitchen Garden crops, will have found some peculiar and instructive lessons this autumn, many of which are worthy of mention. will, perhaps, be remembered by many that we had an exceptionally dry time up to the 22nd of August, owing to which there was much difficulty in getting seeds to germinate, or plants to grow with anything like the freedom one would wish. Turnips that were sown at the end of July made but little progress for the first three weeks, but after that date they grew very rapidly, so much so that by the end of September such varieties as Snowball, Stone. and Veitch's Red Globe were a pound each in weight. Cabbage sown at that date made but poor growth for a while, since which, however, they have done remarkably well. Later sowings of both Onious. Cabbage, Lettuce, and Cauliflowers, have scarcely grown at all, and this has thrown gardeners considerably out of their calculations. In ordinary siderably out of their calculations. In ordinary seasons Canliflower that was sown early in September would by this be large enough for transferring to the cold frames; at the present time they are only just showing the rough leaf. Those who find themselves thus situated would do well to prick the plants out into boxes and keep them growing steadily through the winter, otherwise they will be behind in spring. Although such varieties as Early Forcing or First Crop are useful for sowing in heat at the commencement of the year, and will produce heads before the Walcheren raised from seed sown in the autumn, the latter is a fine main crop variety which, if well grown, never fails to afford satisfaction. Onions, again, may be sown at the present time in pans or boxes, but such sowings entail a considerable amount of labour to produce a crop equal to that obtained from seed sown in the open during August. It is to be feared that the second sowing of Cabbage will in most places prove a failure, particularly will this be so where the soil is heavy and retentive. Where it is more porous the water will have passed through more readily, and therefore not reduced the temperature to such a low degree as is the case on stiff land. The late sowings of Lettuce and Endive have suffered considerably most of the seed perishing in the ground; while Carrots have been just the opposite, for these have grown with marvellous rapidity of late, as sowings made towards the end of July have produced roots that are ready for use. There is a great difficulty in getting the soil dry enough to earth up the Celery, and unless a change for the better takes place soon, much of it will rot before it is ready for use. green vegetable crops are very tender, therefore if we should be visited with an early winter they will suffer considerably. Broccoli have made such rapid progress of late, that a small amount of frost would do them considerable damage; preparations should be made for their protection. It would be advisable to check their growth by timely lifting, there being little danger of them suffering from lack of moisture at the roots. Such things as Parsley are full of sap, and would be affected by the first sharp frost; a good quantity ought therefore to be placed in a convenient place, where protection could be afforded should it be found necessary. It is also well to be provided with material for covering Asparagus beds that are intended for foreing, that the roots may be lifted whenever they are required. Globe Artichokes are also more liable to suffer after to much wet, therefore the ground round their roots ought to be mulched [fine coal ashes are recommended for this purpose. Ep.] to exclude the

frost. If these things receive attention in time, there will be less risk of the plants suffering when winter sets in, but when driven off till late, there is often much difficulty experienced in getting the work done. H. C. Prinsep.

A PLEA FOR THE BARBAROSSA GRAPE.-I send you a photograph taken last year of one of our five vineries at Thornham, when 260 bunches of Barbarossa Grapes ripened well. Our Vine was planted some twenty-five or thirty years ago, to furnish crimson-coloured leaves for dinner-table decoration, in the good old times when the Prince of Wales, the Dukes of Edinburgh and Connaught, and other grandees used to visit here. I think Vines in many houses are much too near the glass. Some forty-eight years ago I lowered the Vines in the other vineries to a distance of 25 inches from the glass; it is easily done by putting spikes in the rafters with a hook at the bottom of each spike for stout wires to rest on, and the Vines dropped down to The Vines are thus much warmer, and the Grapes are earlier fit for cutting. The house in which is the Barbarossa Vine, and which is the subject of the photograph, is span-roofed, 60 feet long, 12 feet wide, The main stem is at and 15 feet to the ridge. about 3 feet distant from the glass at the sides, and rather more than 5 feet from the apex of the roof, so that the warm air plays freely between the leaves and the glass. There are 300 bunches of well-ripened fruit on the Vine this year, half of which we shall place in bottles as seen as the leaves have fallen. This Grape, as most of your readers are aware, is not of such good quality as the Black Hamburgh, but it is an excellent keeper when cut and bottled, and is good even so late as the end of the month The shoots will have rooted in the water of April. contained in the bottles ready for planting if required. off course, all not plants in the house are removed as soon as the Grapes begin to colour. J. Perkins, gardener to Sir Dinald Macfarlane, Thornham Hall, Eye. [The photograph alluded to by Mr. Perkins, shows a very frnitful old Vine of the Black Barbarossa, whose stem was carried round the sides and ends of the vinery, at a sufficient distance from the upright glass to admit of bearing-shoots 3 feet long being laid in ; the central area being similarly furnished with laterals which nearly meet at the tips. The crop was a heavy one and the bunches large, as those of the variety always are under good cultivation. Unfortunately, the photograph is unsuitable for reproduction. Ep.]

SOCIETIES.

NATIONAL CHRYSANTHEMUM.

November 3 and 4.

HRYSANTHEMUMS have been exhibited at the Royal Aquairum during the present week in greater abundance than ever. The National Society, whose care it is to maintain and increase the popularity of the flower, has done all it possibly could to make the celebration of its Jubilee.

an event of such importance that it may be remembered for many years. The Special Jubilee Exhibition, which was opened on Tuesday last, was a remarkable one. The competition in most of the classes was uncommonly large, and the result was such that the Aquarium was filled with the display: and in addition the St. Stephen's Hall was only just capacions enough to accommodate the collections of fruits and vegetables that were arranged there. During the lifternoon and evening of Tuesday the building became so thronged with visitors, that it was a matter of physical impossibility for anyone desirous of criticising the exhibits to effect his purpose. This extraordinary crush towards the latter part of the day, and the had light previous to the illumination of the building by the electric light, was sufficient to impress the least susceptible person with regret that horticulturists are still without a hall or suitable building m the metropolis, where this and everyother exhibition pertaining to horticulture might be held, under conditions less apposite in character to the spuit of horticulture. In any proposed celebration next year by hortenliturists of the completion of sixty years' reign by Her Mijesty the Queen, the provision of such a hall should be given a first consideration.

The exhibition, in regard to in itters of detail, was specially noteworthy for the popularity attending the Japanese varieties. These were increasingly abundant, for instance, there were a dozen entries in the class for sixty blooms of distinct varieties, and near upon thirty collections in a class for twenty-four blooms. The increase of varieties which pro-

duce larger flowers and greater variety in colour and form, is also still maintained. Indeed, the popularity of this section is more pronounced than ever. On the other hand, there was not a single entry in a class for reflexed blooms, and but poor competition in those for Anemore-flowered varieties. We are glad to observe that the single-flowered varieties were well shown in several collections, for their beauty and usefulness entitle them to a greater share of popular favour than they have ever yet been given.

Incurved sorts were present in considerable quantity, but there is little enthusiasm respecting them, and they are unmistakably less popular than in the early days of the National Society. Nor are they exhibited better or even as well as then. The blooms seem more flat, larger, but loss perfect in form, even the old Queen and Princess types, The trained specimen plants were equal to any that we remember to have seen, and it was remarked that some of the newer varieties, such as Viviand Morel, Chas, Davis, Col. W. B. Smith, and Gloire du Rocher, have proved to be suitable ones for this purpose, but the old Christines, Margot, Elaine and Soeur Mélanie, are still unsurpassed. As will be seen from our report, there was a good competition in the open class for a group of Chrysanthemums arranged for effect, but on the whole these exhibits were less interesting than on some former occasions.

The arrangements for such a show, re-organized and reconstructed on Thursday, as these lines are passing throug the press, must have necessitated an enormous amount of work, and it is creditable to Mr. Richard Dean, the Secretary, upon whom most of this devolves, that they were so satisfactory. On the evening of Tuesday a Jubilee Banquet was held, under the presidency of Sir E. Saunders, at the Hotel Metropole.

PLANTS.

OFEN CLASSES.

Groups—There were five competitors in the class for a group of Chrysauthemums in pots, mingled with foliage plants, to be arranged for effect in a circle of 12 feet in diameter. The 1st prize consisted of a Gold Jubilee Medal and £10, and there were three other prizes.

All of the groups were stiged in a line in the gallery directly opposite the centre stage. The small space allotted each, and this being a circular one also, there was not the amount of variety in the method of arrangement adopted that could have been wished. It needed very considerable discrimination to decide the superior merits of one or another.

The 1st prize was awarded to Mr. H. J. Jones, Ryecroft Nursery, Hither Green, Lewisham, a judgment with which we had not occasion to differ. The intention in this case was to include as many plants in the space as possible, and about half of them consisted of novelties of the pre-cut year. Yet there was not undue crowding, each bloom could be seen distinctly and the quality of those was distinctly superior. The face at the base was largely composed of Ferns, including Adiantum Parleyense, also Sclaginella, Dracama Sanderiana, various Crotons, and such like plants. Plants of Gocos Wedelliana relieved the face of the group throughout its circumference, and the summit was crowned by a fine plant of Kentia Fosteriana, which was too heavy for such a position. Mr. W. Howe, gr. to Henry Tale, Esq., Park Hill, Streatham, was awarded 2nd prize, and his exhibit being that of an amateur, was distinctly creditable (see fig. 100, p. 563). The 3rd prize was taken by Mr. W. Wells, Earlewood Nurseries, Redhill, Surrey. The exhibit was arranged to give a light and graceful effect, and this ond was secured in a greater degree in this group than in any, and some judges would probably have placed it 2nd, or even 1st. Mr. Thos. S. Ware, Hale Farm Nursery, Tottenham, was 4th; and the other exhibitor was Mr. W. Davies, gr. to W. F. Darne Ll., Esq., Devenshire House,

Trained Specimens.—There were several collections of these, and most of them deserve special commendation. The principal class was for NISE TRAINED SPECIMENS, distinct, of any or all sections. The prizes offered were liberal, the 1st consisting of a Gold Jubilee Medd and £15; and there were three others of proportionate value. The 1st prize collection was undoubtedly one of the very finest we have seen. It came from Mr. D. Donald, gr. to J. G. BARCLAY, Esq., Knott's Green, Leyton; the varieties were Margot, W. Seward, Pink Christine, Col. W. B. Smith, W. Tricker, Chas. Davis, Viviand Morel, Juo. Shrimpton, and Elaine. The 2nd prize was awarded to Mr. J. Brooke, gr. to W. Reynolds, Esq., The Grove, Highgate, and the plants from this exhibitor were of fine quality also; we noticed one specially good specimen of the variety Gloire du Roeher, 3rd, Mr. W. Davey, gr. to C. C. Payne, Esq., Cedar Ho Ise, Stamford Hill; and tth, Mr. G. H. Cooper, Lower Sydenham Road, Croydon.

Six trained specimen Pompon Chrysinthemums, distinct, were likewise best from Mr. D. Donald; he had White Martha, William Kennedy, a crimson purple reflexed variety; Frances Boyce, a pink-flowered Anemone Pompon; W. Westlake, Yellow Martha, and Soar Mélanie. Mr. J. Brooke was 2nd, and included amongst hie varieties were Black Donglas, Mr. Anstie, yellow; and Adonis, rosy-blog. 5rd, Mr. G. H. Coulle.

CUT FLOWERS.

Jupanese.—The first and most important of the cut flower classes was one for sixty blooms of Jupanese, distinct. There

were at least twelve competitors, and it was expected that the 1st prize would be won by Mr. LLES, the champion of last season; or by Mr. W. MEASE. The judging decided in favour of the latter exhibitor, gr. to ALFRED TATE, Esq., Downside, Leatherhead, who was well 1st. The varieties in this collection were: Back Row: Mutual Friend, a marvellous white; Wood's Pet, International, Jas. Myers, Mrs. Duke of York, Miss Goschen, Madame Carnot, J. Shrimpton, J. Shrimpton, Duke of York, Miss Goschen, Madame Carnot, very fine; Edith Tabor, one of the best yellow novelties; Mrs. G. Carpenter, Simplicity, Mrs. C. H. Payne, Mrs. Dorothy Shea, Mrs. W. H. Lees. Silver King, A. H. Woods, Etoile de Lyon, M. Pankoucke, Australie. 2nd Row; President Borel, Pride of Swanley, Viviand Morel, Mrs. H. Weeks, Mons. Chenon de Leché, a handsome flower; Melle, M. Hoste, Van der Heede, Phosbus, Hairy Wonder, good: Ed. Molyneux, H. L. Sunderbruch, Medame Alf. Chatin, M. Cher Meller, Meller, Meller, Chatalland, Charles, Meller, Meller, Charles, Charles, Meller, Madame and Parker Meller. Chas. Melin, Colonel Chase, Modestum, an excellent yellow; Western King, Violetta, W. G. Newett, Chas. Davis and Oceana, Mrs. B. Ironside, Pride of Madford, Mrs. Chas Blick, Thos. Wilkins, Mons. Gruyer, Mrs. F. Jameson, Eda Prass, Henry Jacotot fils, Florence Davis, Suntlower (not large), Guirlande, Robert Owen, Mdlle, Therese Rev. Mrs. Herman Kloss, Viscountess Hambledon, Lord Brooke, Madame M. Ricoud, Niveum, Souvenir de Petite Ami, and Colonel W. B. Smith. 2nd, Mr. W. H. Lees, gr. to F. A. Bevan, Esq., Trent Park, New Barnet. The flowers in this collection were also good, and most of them were novelties. Edith Tabor, Mrs. W. H. Lees, Madame Rozain, Madame Ad Chatin, Baron Ad de Roths-child, Mrs. J. Lewis, Phorbus, Mutual Friend, Western King, Emily Silsbury, Calvat's Australian Gold (good), Dorothy Seward, International, Miss Elsie Teichmann, Lady Byron, M. Chenon de Leche, are instances, all of which were well represented; 3rd, Mr. A. Haggart, gr. to the Hon. Lucius O'BRIEN, Moor Park, Ludlow; 4th, Mr. J. W. McHattie, gr. to His Grace the Duke of Wellingron, Strathfieldsave.

Incurved Blooms.—Mr. Mease also won the premier award for incurved blooms, and staged sixty very commendable blooms, in not fewer than thirty-six varieties, some of which might be described as excellent, but others were weak. In the back row were Queen of England, of fair quality; Globe d'Or, Empress of India, Golden Empress, C. B. Whitnut, Jno. Lambert, J. Doughty, Major Bonnaffon, Mrs. R. C. Kingston, Lord Aleester, C. H. Curtis, and Robt. Petfield. Second Row: Baron Hirsch, Miss M. A. Hagges, Robert Cannell, Noel Pragnell, M. R. Bahmut, Anni Hoste, J. Lun hert, M. P. Martignat, A. Sulter, J. Agate, Jeanne d'Arc, Lord Wolseley, and William Tunnington. Front Row: Flora McDondd, D. B. Crane, Princess of Teck, rather weak; Refulgens, Brookleigh Gem, good; Mrs. S. Colmun, Princess Beatrice, Mrs. W. Shipman, Empress Eugenie, Mrs. Fulford, Mr. J. Murray, J. Doughty, Mrs. F. Hepper, Violet Tomlin, and Madame Darier.

Of eight other competitors, the most successful was Mr. W. Higgs, gr. to J. B. Hankey, Esq., Fetcham Park, Leather head. The downs were very bright, and but little inferior to those in the collection already noticed. Some of the more attractive in this exhibit were Empress of India, Ami-oste, Jeanne d'Arc, Chas. H. Curtis, J. Agate, Juo. Lambert, Princess of Wales, and Madame Darier. 3rd, Mr. W. H. Lies; and thi, Mr. J. H. Goodacre, gr. to the Earl of Harrington. Elvaston Castle, Derby.

Autonocylor red varieties. There were but two competitors in the class for thirty-six blooms, including specimens of each type. The 1st prize was aw rided to Mr. W. Skeggs, gr. to A. Moseley, Esq., West Lodge, Brinet. He had blooms of Duchess of Westminster, Jeaone Murty, Robin Adair, M. Pankoneke, Owen's Perfectio of Juo. Bunyan, Mrs. Levin, very fine; Sir Walter Raleigh, Mdlle. N. Brun, Mons. Dupanloop, W. W. Astor, Madame Lowton, Queen Elizabeth, M. Ch. Leboseqa, Thermidor, Mrs. J. Benedhet, Descurtes (excellent), Cincinnati, Gladys Spaulding, Acquisition, Gluck, and Miss Margaret. There were pretty Pompon Anemone varieties in the exhibit also, of which we noticed Mrs. Wyness, Antonius, yellow; Emily Rowbottom, blush white; Jeanne Hackett, with yellow cushion and white ray florets, and others. 2nd, Mr. J. Justice, gr. to the Right Hon. Sur R. Temple, The Nash, Kempsey, Worcester. There were some excellent blooms in this collection. Madame Montels, Calliope, Antonius, and Delaware, for instance.

Single-dowered Varieties.—Several competitors entered the class for twenty-four varieties of single-dowered Chrysanthemuns, three blooms of each large variety, and six of the smaller ones. The 1st prize was won by Mr. G. W. Forbes, gr. to D. Nicor, Esq., Regent House, Surbiton. This exhibit compared very favourably in point of beauty and effect with those of other and more popular types. The large flowering varieties were: -Alphonso, pure white, with yellow edged with rose-pink; Ad. Sir T. Symond, yellow; Mand Robinson, red, with yellow centre and dise; Mrs. W. J. Crossley, white, with blush at tips of the florets; Miss Brown, pale pink, with white centre; Jane, pure white; Miss M. Wilde, a very pretty flower of rosy-likae, with white centre; Lady Churchill, deep brown florets, tubular; and Charming, a chest-nut-yellow, very fine. The smaller-flowered ones included Snowdrift, Eurlswood Terra Cotta, Scarlet Gem, Sarah Wells, very pale lilae; Frederick Kauth, elegant; Miss Mary Anderson, the best type of single Chrysanthemum. The Echo, Mora, Old Gold, and Miss Anuic Holden. 2nd, Mr. Jas. Agare, narserymm, Huvant, in whose exhibit we noticed a very dark crimson variety named Gertie Sedgeley, and other good ones; 3rd, Mr. W. Wells, Earlswood Nujseries.

MARKET GROWERS ONLY

This was a class for twenty-four bunches of Chrysanthemums as grown for market. There were only two exhibitors.

and the lst prize was awarded to Mr. Norman Davies, Tho Vineries, Framfield the flowers in this collection were arranged in flat bunches or sprays, and the varieties were Mrs. Briscoe Ironside, Stanstead White, W. Pankoncke, W. Holmes, Major Bonnaffon, Souvenir de Petite Amie, Miss F. Lunn, Chas. Davis, The Talisman, a fine yellow, handsome bloom; Beauty of Framfield, very deep criusen single; the eld Source d'Or, still one of the best; Viviand Morel, Mrs. E. S. Trafford, Eynsford White, Gladys Roult, pure white reflexed; and Pallanza. Mr. F. G. Foster, Brockhampton Nurseries, Havant, who was 2nd, and showed the blooms arranged in round bunches.

SPECIAL JUBILEE PRIZES.

CUL FLOWIE.

For Twinty-four Incurred Blooms Distinct.—The 1st pilze, a solid Silver Teapot, was given by the febthenic Guano Co-This was worthily awarded to Mr. T. Robinson, gr. to W. Lawrenger, Esq., Hollingbourne, whose best flowers were those of J. Agate, Major Bonnaffon, Brockleigh Gem, Lord Rosebery, Mr. J. Gardener, Lord Wolseley, C. H. Curtis, Lord Alcester, Triomphe d'Eve, and Lucy Kendall (a choice exhibit, and remarkably even and bright); cash prizes followed in this class, the 2nd going to Mr. H. Butcher, gr to T. Buss, Esq., Lodge House, Smeath Hill, whose exhibit was rather pale in colour, the best being C. H. Curtis extra fine), W. Tunnington, and John Fulford; and the 3rd to Mr. B. Calvert, gr to Colonel Hotbion, Bishop's Stortford, whose flowers were large and bright.

For Twelve Incurved Bluma, Distinct. The prizes were all in cash the 1st award going to Mr. Silas Cole, gr. to Earl Spincia, Althorpe Park, Nottinghun, who showed strongly, and with large, even, and well developed b'ooms, the finest were John Lumbert, J. Agate (very fine), C. H. Curtis, M. Bahnant, and Golden Empress. The 2nd prize was awarded to Mr. Las Wyatt, gr. to James Perray, Esq., Bradenhurst, Caterham Valley, the flowers not quife so even, but strong in the Queen and Empress families, with Violet Tomlin and Madame Durier, both fine in colour. Mr. Jones, gr. to C. A. Shiru-Ryaash, Esq., Barford Hill, Warwick, was 3rd in this, a very strong class.

For Twelvy Japanese. Anemon: Biomic, distence, is always an attractive class, when, as on this ocasion, the flowers are of good quality. The 1st prize, a Silver Cup, was presented by Messrs. Hato & Hato, London and Dublin, and was awarded to Mr. J. Jastice, gr. to Right Hon. Sir Richard Thmelr. Worcester, who had a jouperly stand, the blooms large, and in good character, the tinest being Enterprise, Sir W. Rideigh, W. W. Astor, Queen Elizabeth, John Bunyan, and Madamic Calrol. 2nd prize in cash, was adjudged in favour of Mr. C. Lourr gr. to the Rev. A. C. Johnson, Capel, St. Mary, Ipswich, whose best blooms were Nelson, John Bunyan, and Enterprise, and the 3rd prize to Mr. Skeggs, gr. to A. Moslay, Esq., West Lodge, Havant, who had another good stand

For twelve invaried bluoms distinct (open to an item growers only), the prizes were presented by the Williams' Memorial Fund, and in the form of Modals. The Silver Medal was awarded to Mr. W. Amits, South Ashford, Kent, the best flowers here were C. Curtis, J. Agate, and Liney Köndall, with D. B. Crane very pretty and distinct, the petals broad and old gold colour; and the Bronze Medal to Mr. Eroward Jones, Bower Street, Bedford, who was 2nd in this class with medium-sized even flowers.

For twelve Japanese blooms distinct (open to annateurs only).—The 1st prize, a "Little Sunson" beating appiratus presented by Mr. 8 am Beales of Harlow, was awarded to Mr Streedwick, Silver Hill, St. Leonards, for a grand stand of richly coloured blooms, the meet being Chas, bavis, Van der Heede, Silver King, Mons. Molin, Rose Wynne, Mutual Friend, and Viviand Morells. The Silver Medal being judged in favour of Mr. Marris Suskey, Shankhin, Isle of Wight, whose best blooms were Huity Worder, Thos. Wilkins, and Mutual Friend; and the Bronz. Medal to Mr. Arthura Stammers, Knowles, Essey, Mutual Friend here was again very fine.

For the press effected by the Veitch Memorial Linux Frustes, the competition was confined to two classes, viz., one for six blooms of the best novelty in Chrysanthemums not previously exhibited, one variety only (Amateurs), in which the prize was one of £5 and the Veitch Memorial Medal; this was awarded to Mr. Marins Silsever, "Providence." Shanklin, Isle of Wight, for grand blooms of a seedling of great promise named Lidy Isabel; it is a very browl-petalled Japanese, of large size and substance; the colour is white, with blush turks as age comes on; quite distinct, with the form of Lord Brooke, to which it is a fitting companion.

In the corresponding class of the Veitch Momoral Trusters for six parieties of Japanese Chapanethemans sent out in 1895 or 1896, three blooms of each, the prize of similar value and the Medal was awarded to Mr. H. Lane, 1, Melville Terrace, Sandown, Isle of Wight. This was an excellent stand, the varieties being Phoebus, very time; Enrily Silsbury, pure white reflexed, fine; W. Fife, colour of Viviand Morel, but shorter in the petal; Mr. C. Otchard, primrose-yellow, rather thin, but large; W. Donniy Taillandier, Chestnut colour, fine and distinut; and Pulluza, a deep golden vellow.

For the reducible cash prives offered by Mr. H. J. Jones, Riceroff Nurveys, Lewistom, In thenty-four Japanes Cheysouthenom blooms, distinct, the competition was exceedingly keen, being, in fact, almost, if not quite unique, no tower than twenty-eight exhibitors competing. The let prize of 4s was awarded, after a close scruting to Mr. Chas, Penfeld, gr. to Sir F. Filzzwyck M. M.P., Leigh Park.

Havant. This exhibit was of unusual excellence, and well set up, the flowers being of extra size as d rich in colour The best were Chas. Davis, Madame Carnot, Edith Tabor, Chenen de Leché (grand), Vander Hede, Viviand Morel, Beauty of Teignmouth, and Edi Prass. The 2nd prize of £6 gong in favour of Mr. Messenger, gr. to C. H. Berrers, Esq., Woolverstone Park, Ipswich, who came close to the 1st prize board, the finest here being Madame Carnot, Phobus, Mrs. H. Kloss, Duchess of Wellington, Mrs. C. H. Payne, and Lord Brooke; whilst the 3rd and 4th prizes of £4 and £2 were respectively awarded to Mr. F. Cole, gr. to Sir Grorge Russell, Bart, Swallowfield Park, the best being Boule d'Or (ninety-five), Modestam, and T. Wilkins; and to Mr. G. W. Drake, nurseryman, Cardiff, whose stand was most commendable and of even quality.

For Tricke Incurved Chrysanthemims, distinct, to be selected from the fist published by the donors (Messis, W. & G. Drover, nurserymen, Farcham), the 1st prize was awarded to Mr. J. R. Heasman, gr. to Mrs. Onley, Fen Place, Turner's Hill, Sussex; the best blooms here were Empress of India, G Iden Empress, Madame Darrier, Mrs. S. Coleman, and Princess of Wales—a pretty and even lot. Mr. T. Lockie, gr to A. J. Thornmill, Esq., Diddington Hall, Huntingdon, was a close 2nd, his best being Jeanue d'Arc, Lord Aleester, and Lady Hardinge; Mr. John Gayner, gr. to Mrs. Anderson, Waverley, Farnham, being awarded the 3rd prize with a good board of even flowers.

For the prize offered by Me 1. W Cuthoch & Sons for six blooms of Japanese Mes Churb. Eleck (open), the lat award was made in favour of Mr. H. Ledge, gr. to Mrs. Mener, Hookerill, Bishop's Stortford, his set of six being much the finest; the colour a pure white, the flowers large, and with the petals of great breadth. Mr Chas. Blick, gr. to Marin Smill, Esq., The Warren, Hayes, Kent, was 2nd, with what looked like another variety; at any rate, the flowers were quite distinct, being more in the way of mainmenth. Howers of Avadanche—they were very time and full.

Fairst Blooms of Chrysanthemum not less than Four Varieties, to be scheded from Mr. J. Godfrey's mine novelties of Ison, the prizes being offered by Mr. W. J. Godfrey, norse ryman, Exmouth, the following awards were made:—Tho 1st to Mr. G. W. Drake, intercream, Cardiff, the finest flowers being those of Pride of Exmouth, broad in petal, suffused with a faint flush; and Mr. Hume Ling, a large rosy-purple variety, of some considerable merit; and the next to Mr. Norman Davis, The Vineries, Framfield

For Six Blooms of Edith Tabor (Japonese, new).—The prizes were offered by Mr. R. C. Notcutt, nurseryman, Ipswich, the 1st being won by Mr. Messenger with three grand flowers, rich deep yellow in colour, broad in petal, and large, this variery is one of great merit, as shown by this exhibitor. The 2nd prize was awarded to Mr. Robert Bassil, gr. to D H. Ex vss. Esq., Shooter's Hill, Paugbourne, equal in colour, and of great excellence. In all, five exhibitors?

TABLE DECORATIONS

For three stands or epergnes of Chrysanthemum blooms suitable for table decoration the competition was very keen, and the exhibits on the whole very suggestive. Mr F W. Seale, Vine Nurseries, Sevenoaks, was placed 1st, with three arrangements in every way suitable for the purpose, the centre one, as it should be, being much the larger, the work was lightly and effectively done, with medium-sized flowers (bronze and yellow), with appropriate foliage. The 2nd prise was awarded to Mrs W. Green, iun., Harold Wood, Essex; this, two, although somewhat bolder and with more colour, was in most respects commendable, the one mistake made was in using three stands nearly of one size.

For one vase of six blooms of any one variety of Japanese thrysautheniums arranged with any foliage—no vase to be more than 1s in bes in neight—the 1st prize was awarded to Mr. James Brookes, gr. to W. J. Newman, Esq., Park House, Totteridge, who employed Madame Carnot to good effect The 2nd award being made in favour of Mr. D. Crant, Highgate, N., he depending on a yellow variety. Two or three other exhibits in this class ran these two exhibitors very closely.

There were classes, too, for vases containing Chrysanthemum blooms, arranged with foliage, &c., to lest effect.

FRUIT CLASSES.

These generally were remarkably well filled, the competition being not only keen, but the quality generally was very high. The Grape collection class was a surprise, no less than 166 bunches, mostly of fine form and quality, being staged No wonder the judges had to take some time in their deliberations.

Collections of Fruit. Only three lots were staged, exhibitors apparently finding it difficult to make nine good dishes. The best came from Mr. Gleeson, gr. to C. J. Keyser, Esq., The Warren, Stammore, who had nice Museat of Alexandria and Mrs. Pince Grapes, a good cluster of Bauanas, Pines, Melons, Apples, Pears, &c. Mr. J. Hayes, Castle Ashly Gardens, Northampton, was 2nd; and Mr. J. W. Empson, gr. to the Hon. Mrs. Wingetter, Ampthill, was 2rd.

trapes.—There were fourteen collections of twelve bunches staged, to include not fewer than tour varieties. It was with five only that Mr W Taylor, gr to C Bayer, Esq., Forest Hill, won the 1st valuable prize, having of whites, fine Trebbiano, and good Muscat of Alexandria, also very perfect Alicante, Gros Colmur., and Gros Maroc Very close indeed came Mr Taylor, gr to Alderman Chaffin, of Bath, who had fine Gros Colmur. Alicante, Gros Maroc, Madresheld Court, Foster's Seedling, Muscat of Alexandria, and a rather small

cluster of Canon Hall Museat. Mr. Goodacre, gr. to the Earl of Harrington, Elvaston Castle, was 2rd; and Mr. W. Tidy, gr. to W. R. D'ARCY, Esq., Stammere Hill, was 4th.

In the class for three bunches of any white, eight lots being staged, Mr. They was 1st with capital Muscat of Alexandria; Mr. F. Cole, gr. to Sir G. Russunt, M.P., Reading, was 2nd, having fine bunches, though not large berries; and Mr. Taylor of Bath was and with the sune

Black Grapes in three bunches were represented by seven lots, the best, very handsome Alicante, coming from Mr. Tarlor of Forest Hill; Mr. They being 2nd with the same variety; and Mr. Taylor of Bath was 3rd with fine Gros Muroe. In a class for Gros Colmar, the prizes given by Messrs. W. Thompson & Sons, Clovenfords, these three exhibitors repeated their wins in the same order, all having very fine bunches and grand berries, though in no ease too black. In this class eight lots were staged.

Pears and Apples .- These fruits always figure largely at the National Chrysanthemum Seciety's November Show, but they seemed to be exceptionally good this year. Mr. A. J. Thomas of Sittinghourne had the best six Pears in Beurré Clairgeau, Beurré Diel, Doyenné du Comice, Pitmaston Duchess, Columbia, and Madame André Leroy. Mr. G. Wood-WARD, Barbam Court Gardens, Maidstone, was 2nd, having capital frints of Beurre d'Anjou, Pitmaston Duchess, Emile de Heyst, Fondante de Noix, Beurre Diel, and Dovenne du Comice. Mr. Stowers of Sittinghourne was 3rd.

Dessert Apples were in beautiful form and colour, and of excellent size, and there were a dozen lots of six varieties, the best and most beautiful fruits coming from Mr. W. Kino, Gatton Park Gardens, Reigate, who had American Mother, Cox's Orange Pippin, Blenheim Pippin, King of the Pippins, Ribston Pippin, and Cox's Pomona. Mr. 6. Woodward was 2nd, having also beautiful fruits of Baraack Beauty, Ribston, and Cox's Orange Pippins, Calville R sige, Melon-Apple, and Brabaut Bellefleur. Mr. Thomas, of Rodmersham, was 3rd, having in his six, good Barchard's Seedling, Claygate Pear main, Fearn's Pippin, and Glory of England, which is evidently Gascoigne's Scarlet.

Of cooking Apples, eleven lots being sent, samples generally were very fine. The judges seemed to have been taken with the high colour found in Mr. Kind's half-dozen dishes, though others materially excelled them in bulk. The varieties were Pomona, Peasgood's Nonsuch, and Beauty of Kent. Mr. Woodward was again 2nd, having splendid samples of Stone's Pippin, Lane's Prince Albert, Emperor Alexander, Pensgood's Nonsuch, Waltham Abbey Seedling, and Belle du bois. Mr. STOWERS was 3rd, also having remarkably fine samples. In other parts of the building there were very fine and extensive collections of Apples and Pears, from Messrs, W. & J. Brown, Stamford, Mr. H. BERWICK, Sidmouth, who had capital samples; as also had Messrs J. Laing & Son, Forest Hill, whose fine heaps and dishes were prettily dressed with plants; Messrs. Srooner & Sons, Hounslow, who largely used flat baskets; Messrs. C. Lee & Sons, Hammersmith; and Messrs, Cureush & Sons, Highgate.

Messrs, D. & W. Buchanan, String, had fine bunches of Grapes, and baskets of the same, and Tomatos; also largely exhibiting samples of Vine leaves, richly coloured.

$\mathbf{V}_{\mathrm{E}\mathrm{U}}\mathbf{E}_{\mathrm{U}}\mathbf{E}_{\mathrm{U}}\mathbf{E}_{\mathrm{U}}\mathbf{E}_{\mathrm{S}},$

Rarely has there been seen such an array of high-class growers, or such splendid quality, as was found on the tables on this occusion. The splendid prizes offered by Messrs, Jas. Carter & Co., Webb & Sons, Sutton & Sons, Harrison & Sons, Johnston & Sons, &c., as also by Messes. Dobbie & Sons, proving wonderfully attractive.

Messrs, Jas. Carter & this Classes. - The first of these was f ten kinds of vegetables, fifteen collections being staged. E Beckett, gr. to Lord ALDENHAM, Elstiee, was 1st, having superb samples of Leeks, Intermediate Carrots, Giant Red Celery, Cauliflowers, White Turnips, Potates, Tomatos, Ailsa Craig Onions, good Beet, and Erussels Spronts. Ailsa Craig Onions, good neet, and Edussias squares. All Brown, gr. to W. Henry, Esq., Abbots Langley, was 2nd, haviog somewhat similar kinds; Mr. C. J. Waite, gr. to the Hon. Col. Talbot, Esher, was 3rd; Mr. W. Pope, Highelere Gardens, coming 4th; and Mr. Bowerman, Hackwood Park Gardens, was 5th.

With nine bulbs of Carter's Record Onion, Mr. Bowerman was 1st, Mr. Pour being 2nd, the samples being exceptionally large.

Webb & Co.'s Prizes. There were fourteen collections of nine dishes, also for valuable prizes, staged in this class. Here Mr. Bowerman was a good 1st, having a faultless collection, including grand Lecks, Carrots, Onions, Celery, Beet, Cauliflowers, Potatos, Tomatos, &c.; Mr. T. Wilkins, gr. to Lady Theodora Guest, Henstridge, was 2nd; Mr. Walle being again 3rd, and Mr. E. BECKETT 4th.

Messes, Harrison & Son's Class,—This was for six dishes only, and Mr. W. J. Eurson was 1st with very nice samples of Cauliflowers, Perfection Carrots, Cocoa-nut Onion, Satisfac-tion Potatos, Tomatos, and Parsnips; Mr. Bickett was 2nd, and Mr. WAITE 3rd,

Messes. Sutton d. Son's Prices. -- These were limited to Potatos, eight lots of fifteen dishes being presented in one case. Here Mr. E. S. Willis was a good 1st, having very beautiful bright samples of Abundance, Nonsuch, Satisfacbeautiful bright samples of Abundance, Nonsuch, Satisfaction, Windsor Castle, Perfection, Magnum Bonum, Reading Ruby and Russet, &c.; Mr. W. Pore, whose samples also were capital, was 2nd; Mr. Downeswell, Sattinghourne, heing 2nd; and Mr. S. Colle, The Gardens, Althorpe, 4th. In the class for two varieties, Mr. Walle was 1st, with Windsor Castle and Supreme; Mr. Walle was 1st, with

The Society's Chase for six dishes brought a stiff competition. the varieties largely being those mentioned Mr. E. S. Wiles was 1st; Mr. E. Chapping, Sittingbourne, 2nd; and Mr. Downeswell 3r l.

Messrs. Johnson's Classes. —There was again good compatition or this firm's prizes, for twelve varieties, in which competitors already named figured largely, with capital samples.

Messes, Dubbes & Sous' Classes -These were all for single dishes, and a wonderful competition resulted, there being, for instance, some sixty or more half-dozons of Leeks, the majority coming from Scotland; but, oddly enough, Mr. Bowerman of the South came 1st with lunge specimens, wonderfully blanched. Mr. Foster, gr. to T. F. Halsey, Esq., near Hemel Hempstead, was 1st for Globe Onions, Mr. Bowerman again coming 1st for flat samples. Mr. W. Dendy of Horsham had the best six Beets, and Mr. Scott of Haddington had medium-sized, clean, pretty Intermediate Carrots, Mr. E. Beckerr staged the finest, best blanched, and heaviest white and red Celery, Mr. Warre the best Parsnips; but See tehmen were the only exhibitors of yellow Turnips, sen ling most beautiful Golden Bill, the best e uning from Mr. Lancrod of Fife; Mr. Mackinnon of Crieff being 2nd. It was specially noticeable that most of the leading prizes in these classes went to the Southeners. A good number of Parsnips and Beets ran rather big and ourse. Evidently some instruction in what constitut s handsome and desirable exhibition samples is still greatly needel. If orling the star to star greaters as the judging this do not learn better from the object-lessons the judging gives them, then nothing will help them.

HONORARY EXHIBITS.

There were non-competitive exhibits of flowers, fruits, vegetables, horticultural sundries, and implements, and of most articles pertaining to horticulture. Below noticed all of the important stands in this section.

noticed an of the importance status in this section.

Messers, Jas. Vetten & Sons, Royal Exotic Nursery, Chelsen, had a group of Chrysanthemum plants in flower, in which they exhibited numerous novelties of the present The plants had been well cultivated, and the group season. presented a bright and good display.

Mr. NORMAN DAVIS, Framfield Nurseries, Sussey, made an uncommonly attractive exhibit, immediately under the great organ, upon the ground-floor. The cut-blooms were arranged boards, and in ornamental vases, and deep graceful The adornment of the group with rdasses materiall and plants represented the best taste (see fig. 99, p 562); nor was the quality of the blooms other than firstclass-Niveum, Modestum, and Western King, in vases and glasses, were superb. Many novelties were also deserving of attention.

A non-competitive exhibit by Mr. II. J. Jones of Chrysonthemum blooms in vases upon stands, and amidst a prefusion of ornamental foliage plants and other decorative material, attracted consider idle attention. The whide had an artistic and well furnished appearance. The cut blocus upon the stands were of excellent quality, and were representative of

Messrs, H. CANNELL & Sons, Swanley, Kent, made a great show. One of their tables, of considerable length, pres an exceedingly bright appearance, it being built up high, with an exhibit in the shape of a ridge. On one side there was a display of zonal Pelargonium blooms in sprays, a cluracteristic feature of Messrs, Cannell's exhibit shows. On the opposite side was staged a magnificent collection of Chrysanthemum blooms, including a above the other distinctly, and telieved with pieces of Cyperus, all in excellent taste. Many of Calvat's recent varieties were included, and others of English and American raisers. Novelties that Messrs, Cannella are sending out include Baron Tait, a seedling from Primrose League, a include Baron Tait, a seedling from Printrose League, and golden-yellow in colour. Mrs. Operto Tait, also yellowing the property of the proper Ella Curtis, also Japanese, with long florets of bronze or dark buff and yellow. Austin Cannell, sair to be a good incurved. Robert Powell, a Japanese of great depth, in colour buff and yellow, and others. A fine display of Queen Charlotte and other varieties of Cannas were from Messrs Cannell too, and the old Tom Thumb Pelargonium, and a few very weedy-looking Chrysanthemum plants, said to be a fre-simile of the quality of exhibits fifty years ago.

M ERNEST CALVAR, the celebrated raiser of new Chrysonmuins at Grenolde, France, sent over a few blooms representing his latest novelties, but from those sent an accurate estimation of their value could hardly be made.

Mr. H. Shoeswirh, Claremont Nursery, Woking, exhibited upwards of six dozen blooms of Chrysanthemums, including a dozen exquisite flowers of Mons. Chenon de Leelié; Madame 'arnot, H. L. Sunderbruch, Viviand Morel, Mutual Friend,

and others, were capital.

A very large exhibit of Chrysanthemum flowers was made by Mr. W. J. Godfrey, Exmouth Nurseries, Devon; some of them were shown as bunches, useful for decorative purposes. including Clinton Chalfont, a fine yellow variety men blooms of new Chrysanthemans represented a great number of varieties — Particularly fine were Australian Gold Calvat), Mutual Friend, Baron Ad. de Rothschild, Oceana, Pride of Exmonth, Modestum, Miss Elsie Teichmann, Phodous, and others,

Another exhibit of cut blooms was from Mr. Owln, of Castle Hill Nurseries, Maidenhead, in which were several seedling varieties of considerable promise, and other new

ones now extensively exhibited.

Messrs, Cuthush & Sons' stand in one of the galleries

included a fine lot of Chrysanthemum plants, also Sonvenir de la Malmaison varieties of Carnation, Heaths, winterthe in Mammason universes of Carmanos, Hearins, winter-flowering Begonius, &c.

Messrs. B. S. Williams & Sons, Upper Holloway, London,

Messers, B. S. Williams & Sors, Upper Holloway, London, N., had a group of Orchids and foliage plants. There was a nice collection of Cattleya, gigns and C. Iabiata, &c.

Mr. Isaac House, Coombe Nursery, Westbury-on-Trym, showed flowers and plants of the Violet California, and Pansy blooms; whilst a group of plants in flower of zonal Pelargoniums, King of Denmark, was from Mr. M. Larsen, Roebnek Nursery, Enfield Highway.

Mr. W. Pier v. 9, Beadnell Road, Forest Hill, London, S.E., showed bunches of Chrysinthemum blooms. One of the fountains was well decorated with Chrysanthemum blooms and ornamental foliage plants, by the ICHTHEMIC GUANO

Company, Ipswich.
Messrs. D. & W. Brohaman, Forth Vineyards, Stirling, exhibited some remarkably fine Gros Colmar Grapes, and prettily-tinted Vine leaves,

Mr. W. M. MIDCHELL, Luton, Chatham, Kent, exhibited a "Chrysanthemun Plant Protector." The pot containing the plant is isolated by means of water, to prevent earwigs, &c., from reaching it, and thus obtaining access to the plant. Another invention, to effect the same purpose, was one shown by Mr. H. F. Brown, 129, Selhurst Road, South Nor-This is known as "The Island Plant Protector," and wood. This is known as "The Island Table Treeter, and a consists of an earthenware saucer to contain water, and a deep pan to be inverted, and stood in the former; upon this is placed the pot containing the plant. Messrs. Darby & is placed the pot containing the plant. Messrs. Darby & Sons, Westen Street, King's Cross, London, exhibited stoves for heating conservatories, &c. Another stand was devoted to specialties of Messrs, Laws, manure manufacturers, Mark Lane, London.

Mr. P. WATERER, Fawkham, Kent exhibited a collapsible show board; and Messrs, Still, & Co., 24, Charles Street, Hatton Garden, London, S.E., displayed "Bockett's Exhibi-

The Springthorpe Exhibition Flower Tubes were shown by SPRINGTHORPE, Combe Court Gardens, Kingston-on-Thames.

Very beautiful indeed was the collection of Potatos set up on a luge table by Messrs, Sutton & Sons, of Reading. They had on view big heaps or baskets of all their best and most productive varieties, including some thirty-two distinct. these wonderfully fine were Satisfaction, Windsor Castle, Sutton's Flourball, Magnum Bonum, Sutton's Seedling, Supreme, Reading Russet, Best-of-All, Harbinger, Triumph, and others, including a grand-looking new white Kidney, named Reliance.

Messis, H. Deverill & Sons, Banbury, had, with other vegetables, superb examples of their Allsa Craig, Cocoa-nut, Rousham Park Hero, Good Keeper, and other Onions, with

Rousham Park Mero, Good Keeper, and other Onions, with fine Leeks, Best, Celery, &c. Messis, Jas. Carren & Co., High Holborn, staged, also on a huge table, a wonderful collection of Gourds, Cabbages, Pot too, Onions, Tarnips, Celery, Cauliflowers, &c., making quite a vegetable trophy,

Messrs, W. Jounson & Sons, Boston, had a fine and very varied collection of Potatos, capital samples of Up-to-Date. Johnson's Prolific, Satisfaction, Chancellor, Abundance, Snowdrop, Jeannie Deans, and many others,

Showdrop, Jeannie Deans, and many others.

Messrs D. Dowell & Son, Ravenscourt Avenue, Hammersmith, had a display of horticultural sundries gardenpots, &c. Messrs, Carter, Page & Co., 52 and 53, London Wall, E.C., also exhibited a considerable quantity of gardeners' requisites, manures, &c.; and from the Agricultural AND HORDCULTURAL ASSOCIATION. Ltd., Deptford, London, was a similar exhibit.

32, St. Paul's Road, Camden Town, Mr. Jus Arsmin London, N.W., exhibited peat, leam, and other requisites for the garden.

Mr. J. George, Horticultural Sundriesman, had a tab'e well filled with specialties from the sundriesman point of view; and some remarkably fine Grapes that had been produced with the help of Thomson's Vine-manure.

Messrs, Wood & Son, Wood Green, London, N., had a considerable space devoted to the exhibition of peat, Mushroom Messrs. Fenion & Son, S, Tudor Street, Temple, London,

showed a variety of gas and oil-heated hot-water boilers. Messrs. R. Sankey & Son, Nottingham, showed a variety

of earthenware flower-pots. Mr. Sam. DEARDS, 14, Old Broad Street, London, ex-

hibited heating apparatuses.

Greenhouses were shown by Messis, Steward & Pover, Rhodeswall Wharf, Limehouse, London; and by Messis, PEARCE & Co., Holloway Road, London.

THE BANOLET.

The banquet in connection with the Jubilee celetration the society took place at the Hotel Métropole on the evening of the opening-day. S.r Edwin Saunders, the evening of the opining-day. S.r. Edwin Saunders, the President, in the chair, supported by Sir Trevor Lawrence, Bart., the President of the Hoyal Horticultural Society; Messrs. F. A. Bevan, C. E. Shea, C. C. Paine, and R. Balantine, as representing the vice-presidents; also Messrs. J. H. Veitch, T. Harrison, H. J. Cutbush, H. Turner, Williams, Geo. C. Bompas, Leonard Sutton, W. Robinson, Dr. Henry Bond, P. Wattrer, &c., the vice-chairs being occupied by Messrs, B. Wynne, R. Dean, T. W. Sanders, and T. Bevan. After the usual loyal toasts, the Chairman proposel success to the National Chrysanthemum Society, remarking that it was originally founded at Stoke Newington, in 1846, and from that point travel the history and development of the Society from 1846 to the present time, dealing with the facts much

as they are set forth in an article upon another page. The toast of affiliated Societies was given by Mr. C. E. Shea, and responded to by Mr. T. Bevan. That of President of the National Chrysanthemum Society was given by Sir Trevor Lawrence, who emphasised the importance of establishing in London a Horticultural Hall available for the different special societies to hold their exhibitions in. In responding to the toast of the donors of special prizes, Mr. F. A. Bevan strongly recommended the adoption of a more suitable place n which to hold their exhibitions—a sentiment which was warmly cheered by the company. The Press, proposed by Mr. J. Harrison, was responded to by Mr. George Gordon.

Thursday, November 5.

A second competitive show took place on Thursday, and was continued yesterday. The character of the schedule more nearly resembled that used at the annual shows than did the one followed on Tuesday last, in which were included so many special Jubilee features. All of the non-competitive exhibits that were stage I on Tuesday were continued until Friday night, but some of them were brightened by the addition of a few extra blooms, &c. In addition to these, so many of the competitive exhibits that were of fruits or vegetables were continued also, and also the five groups in Tuesday's competition. The change was therefore principally evident in the cut flower classes and table decorations, &c., the whole of the exhibits of which were renewed. Upon the whole there was less competition in the classes than on Tuesday, but some specially popular ones were very well and keenly contested.

In the exhibit from a foreign member of the society. the exhibits did not equal expectation. In the special class of F. A. Bevan's, Eq., for twenty-four blooms of white Japanese Chrysanthemums, the front row of booms to be raised 6 inches above the board, and the middle and back rows raised in proportion, there was no exhibit, although there had been one entry made. As the more important classes in Thursday's competition were secured by Mr. W. H. LEES, there has been no champion at this season's festival who, as last year, won almost all the chief honours. There is a conference to be held as our pages pass through the press, at which several papers upon the Chrysanthemum will be read,

CUT FLOWERS. AFFILIATED SOCIETIES. COMPETITION.

The first class was the usual one arranged for Horticultural and Chrysanthemum Societies to compete. exhibite twenty-four blooms of incurved and twenty four blooms of Japanese varieties. There were five competing collections, and the let prize consisting of the Challenge Trophy and £10 was won by the Portsmouth Chrysanthemum Society, and £10 was won by the Portsmouth Chrysanthenium Society, the blooms being furnished by Mr. AGATE of the ILevant Nurseries, and Mr. Penfold, gr. to Sir F. Firzwicken, Leigh Park, Havant. The varieties of Japanese staged were back row: Viviand Morel, Mons. Pankoucke, Eva Knowles, Mrs. G. Carpenter, Mutual Friend, Phobbus, Van den Heede, and Madame Carnot, extra good. 2nd row: C. Davis, Etoile de Lyon, Mdlle. A. de Gilbert, International (good), Ethel Addien, Phinne Briters a good white: Reine d'Audstern. Addison, Phippe Riviore, a good white; Reine d'Angleterre, and Edith Tabor (fine). Front frow: M. Ricoud, Win. Seward, M. Chenon de Leché, Amiral Avellan, Mdlle. T. Rey, Beauty of Teignmouth, Golden Gate, and Madame E. Capi-The stand of incurved blooms included several of much merit, the varieties were, Back row : C. H. Curtis, Lord Al-Globe d'Or, Empress of India, Major Bonnaffon, ingston, Jas. Agate, Emily Dale. 2nd Row: Jeanne cestor, Globe d'Or, Empress of India, Major Bonnafion, R. C. Kingston, Jas. Agate, Emily Dale. 2nd Row: Jeanne d'Arc, Golden Empress, Baron Hirsch, Queen of England, Violet Tomlin, Miss A. Haggas, William Tunnington, R. Petfield. Front Row: M. Darior, Brookleigh Gem, Lord Rosebery, Juo. Fulford, Prince Alfred, Princess of Wales, Lord Wolseley, and C. B. Whitnell.

The disparity in quality between the above collection and that from the Bromley and District Chrysanthemum Society Some of the best Japanese blooms in was oxeeedingly little. this collection were Madame Carnot, M. Chenon de Lechi. Graphic, Beauty of Teignmouth, Edith Tabor, International, Viviand Morel (exceedingly good colour), Australie, A. H. Wood (not quite at its best), and Sunflower. Amongst the incurveds we noticed fine-blooms of Lord Alcester, Empress of India, Mme. Darrier, Golden Empress, C. H. Curtis, and Miss Haggas; 3rd, the Southgate and District Chrysanthemmn Seciety.

Incurred blooms. - The best thirty-six incurved blooms, distinct, in competition for the Holmes Memorial Challenge Cup and £10 was from Mr. W. H. Lees, gr. to F. A. Bevan, . Trent Park, New Barnet. The varieties staged were :-Back row: Chris. H. Curtis, Mons. Bahuant, J. Agate, Globe d'Or, Robt. Petfield, Major Bonaffon, Queen of England, Perle Dauphinoise a Japanese incurved, as shown', Empress of India, Baron Hirsch, Juo. Lumbert, Mrs. R. C. Kingston, 2nd 10w: Madame Darrier, M. P. Martignat, Ma Perfection and tow: Martine Darrier, M. F. Martignat, Mr Perfection (weak), Prince Alfred, Hero of Stoke Newington, D. B. Crane, Lord Wolseley, Mrs. Coleman, Lord Rosebery, Mrs. Haggas, Jeanne d'Arc, Violet Tomlin. Front row: Princess Teck, Barbara, Lucy Kendall, Mrs. N. Davis, Beauty (weak), Bonnie Dundee, J. Lyne, Jr., Princess of Wales, Mr. Brunlees, Brookleigh Gem, Lady Dorothy and Mrs. Halliburton, 2nd, Mr. W. Higgs, gr. to J. B. HANKEY, Esq., Fretsham Park, Leatherhead. The best blooms in this stand were Miss Haggas, Madame Darrier, Chas. H. Curtis, J. Agate, Mrs Beale, Empress of India, Princess Teck, Lord Alcester

Jeanne d'Are; 3rd, Mr. F. G. Foster, Brockhampton Nurseries, Havant; 4th, Mr. B. Calvert, gr. to Col. Archer, Houblin, Hallingbury Place, Bishop's Stortford.

Six Incurved, one Variety, -Here Mr. J. Jones, gr. to C. A. SMITH RYLAND, Esq., Warwick, was an easy first, having some of the finest blooms of C. H. Curtis ever seen. The same variety from Mr. F. G. FOSTER, Havant, was 2nd; and fair, Violet Tomlin, from Mr. CALVERT, was 3rd.

Japanese Blooms.—In the principal class for Japanese blocas and in the competition for the Holmes Memorial Challenge Cup and £10 as first prize, the principal exhibitors on Tuesday last reversed their positions, and Mr. W. H. LEES won with forty-eight distinct blooms of much merit. The varieties were: Buck Row Mrs. W. H. Lees, Edwin Molyneux, Calvat's Australian Gold, Australie, Mutual Friend (fine), Chas Davis, A. H. Wood, Pride of Madford, Lady Saunders. Hairy Wonder (large bloom, not first-rate in colour), Phoebus (very good), Etoile de Lyon, Malime J. Bernard, Edith Tabor, Jno. Shrimpton, Madame Carnot (good); Modestum, Viviand Merel, Emily Silsbury, Le Moucherotte, Miss Elsie Teichmann, Miss Ethel Addison, Duchess of Wellington, Col. Chase, Reine d'Angleterre (good in Colour), Louise, Mrs. C. H. Payne, Mephisto, Thos. Hewitt, Mrs. F. Jameson, International (good), M. Chenon de Leche Front Row—Mrs. H. Weeks, Denil de Jules Ferry (very distinct in colour', C. W. Richardson, Mons. Ad. Girond, Amiral Avellan, Souvenir de Petite Ami, Mrs. Wheeler, Amiral Avellan, Souvenir de Petite Ami, Mrs. Wheeler, Rose Wynne, Sunflower (goed), Mons. G. Montigny, Mrs. J. Lewis, G. C. Schwibe, Mrs. H. Kloss, Oceana, Viscountess Hambledon, and Florence Davis, both of the last named good. Mr W Mrysr was not very far behind, but generally his blooms appeared a little smaller. Some of the best were Mons. Pankoneke, Viviand Morel, Mrs. G. Carpenter, Miss D. Shea, President Borel, Mrs. W. H. Lees, M. C. Molm, Duke of York, Australie (very fine), Lard Brooke (a deep flower), International, E. Molyneix. H. Lees, M. C. Moill, Duke of York, Australie Very mer, Lord Brooke (a deep flower), International, E. Molyneux, (very good in colour), Machame Carnot, a large sized bloom Muthal Friend, Chus Davis Gel, Mr.W. Higgs, ger to G. B. HAWKES, Esq. Fetcham, Eark, Leatherhead, There were several very first-class flowers in the collection, that at any other show would probably obtain a first prize. 4th, Mr. L. Dunmall, gr. to P. WATERER, Esq. Fawkbain.

Twenty-four blooms on not free than righteen current. special prize of a Silver Cup was added in this class, to the 1st prize of thirty shillings. There were six or more competitors, and the collection of blooms that won for Mr. Jes. STREAMSCEK, Silver Hill, St. Leonords, the first position in the class could not be described as other than a commendable one, the flowers being even in size, and good in colour and quality. The varieties were Bock Rose, Viviand Morel, Matual Friend, Chas. Davis, Mrs. C. H. Payne, Chas. Davis, Viviand Morel, M. Pankoucke, International, T. Wilkins, Mutual Friend, Chas. Phys. Jus. C. R. Fayne, Chas. Phys. Wivind Morel, M. Pankoucke, International, T. Wilkins, Madame de Galbert, Viscountess. Humbledon, Phiebus, Miss Dorothy Shea, Beauty of Teignmouth, M. Chas Molin, Rose Wynne, Silver King, Mr. A. H. Neuve, Van den Hiede, Edu Prusse, and R. Dean. The names of the flowers should have Prusse, and R. Dean. been written more distinctly 2nd, Mr. H. Love, Melville Terrace, High St., Sundown, Island Wight. This exhibit consisted of blooms of good average quality, but too small to he first-class. Srd. Mr. Geo Hear, Compton, Guildford. 4th, Mr. W. Amiss, South Ashford, Kent.

relevibleom: distant.-In addition to the 1st prize of thirty shillings, there was in this class a special prize of a Silver Cup given by Mr. F H. CLEMOW. There were seventeen competi tors in this popular class, and the fortunate exhibitor to whom the 1st prize was awarded was Mr. W. Robinson, gr. the Rt. Hon. LORD JUSTICE LOPUS, Westbury, Wilts. back row was a specially good bloom of Madame Carnot, and one of Primrose League, the latter a little too pale in colour probably; Hairy Wonder, Pride of Exmouth, Viviand Morel, Mrs. Hume Long and Pride of Madford were also of extra merit. The rengining varieties were Edith Tabor, Oceana, Commandant Blussett and Lady Ridgeway. A collection of much beyond average merit obtained 2nd prize for Mr. W. Słogrove, gr. to Mrs. Crawfort, Gitton Park, Reigate. The varieties Viviand Morel, M. Chenon de Leché, International, Étoile de Lyon, Amiral Avellan, Thos. Wilkins, and G. C. Schwabe were the best here; 2rd, Mr. J. Brookes, gr. to W. J. Newman, Esq. Park House, Totteridge, who included fine blooms of Viviand Morel, Chas. Davis, and Command at Blussett; 4th, Mr. W. Messenger, gr. to C. H. BERNERS, Esq., Wolverstone Park, Ipswich.

Six Japanese White, Ow Variety -The best blooms, those Madame Carnot, wonderfully fine, coming from Mr. Jas. Gibson, gr. to A. H. Wafts, Fsq. Chiswick. Mr. Calvert

coming 2nd with Midlle Theresa Rey; and Mr. T. H. Lodge 3rd with Mrs. C. Blieh. Six Flooms of any other Colonic.—Mr. W. Roddinson was 1st with splendid Vivi and Morel; Mr. Fordes coming 2nd with E. Molyneux; and Mr. J. Witt, gr. to H. Bell, Esq., was 3rd with fine coloured B. Smith.

Six Japonese Turnived were hadly good examples of this n. Mr. Robinson, gr. to Lord Justice Lores, West-had the best in Louise, Australie, Oceana, Pride or Mudford, Miss E. Addison, and one unnumed. Mr T CARVER was 2nd, and Mr Messenger, gr. to C. H. Berners, q , Ipswich, 3rd.

Sir Japanese Blooms, heiry peter of rarieties.—There was but one half dozen, coming from Mr. W. Bitchelor, gr. to Lieut.-Col. VERNON. Unbridge, who had Hairy Wonder, Vancanson, Mrs. De Ward, Louis Boelmee, Lody of the Lake, &c.

Reflexed Blooms. On this occasion there were five collections of large-flowered reflexed blooms exhibited, but at the pre-vious competition on Tuesday last there was no exhibit of

reflexed varieties present. The dozen blooms in this instance were required to represent nine varieties at least Mr. W. Mease, gr. to A. Taff, Esq., added the 1st prize in this class to his other triumphs, and the varieties he showed were Christine, Pink Christine, Cullingfordi, Mrs. Forsyth, Cloth of Gold, Fred Hart, Dr. Sharpe, Phidias, and Crimson King; 2nd, Mr. W. Robinson, gr. to Lord Justice Lotes, whose bloom of Cullingfordi was specially well redoured; 3rd, Mr. R. C. Norcua, Broughton Road Nursery, beswich. Evidently the interest in these reflexed varieties is on the wane.

Large-floweved and Japanes Anemone, Twenty-four Blooms. A capital class, the blooms generally being very fine. II. Prickett, gr. to T. M. HARVEY, Esq. East Barnet, was 1st, with Owen's Perfection, Madame Lawson, Bucher-Toulousienne, Dame Blanche, Queen Elizabeth, Lady Mar, garet, Caledonia, W. W. Astor, La Deuil, Descartes, Emperor, and Thorne Junior, amongst others, very fine; Mr. J. Moule, gr. to H. T. WILLIAMS, Esq., Hadley, was 2nd, having Benediet, Mr. Lawson, J. Bunyan, Ernest Callie, and G. Spaulding, good; Mr. Skeggs, gr. to A. Mosley, Esq., Barnet, was 3rd.
Twelve Large flowered, Japanese excluded.—Mr. C. Light, gr.

to the Rev. C. E. Johnson, Ipswich, was 1st, having good blooms of Fleur de Marie, Ludy Margaret, Delaware, G. Speulding, Miss A. Lowe, &c.; Mr. Skeour was 2nd; and Mr. MAULE 3rd.

Twelve Panapais, distinct. - The trebles made a good class, the best coming from Mr. Caryer, gr. to Mr. W. Messner, who had good Toussaint Marie, Rubra perfects, Prince of Orange, President, Black Douglas, Comte de Morny, Osiris, W. Westlike, &c.; 2nd, Mr. Mills, gr. to F. Hove, Esq., Croyden, who had some Anemones in his lot; Mr. T. L. Turk, gr. to T. RONEY, Esq., coming 3rd.

Stugb's, set up to Trebles, unde a charming class, and were mnerous. Mr. J. Myeas had the best in Purity, Snownumerous. wreath, Mrs. D. B. Crane, Bertie Sedgley, Golden Star, Effic, Ewan Caneron, George Rose, &c.; 2nd, Mr. G. W. Forbes, gl. to D. Naot, Esq., Surbiton; Mr. W. Wells, Earlswood, being Srd.

AMATEUR CLASSES.

Six Japanese blooms detired, a capital class; Mr. A. N. KNIGHT, Ashford, Kent, was best with fine Phochus, Préfet Robert, Mr. Schwaber, Ju'es Ferry, Madame Carnot, and Viviand Morel. Mr. Silsberg was a capital 2nd, having Hairy Wouder, La Moucherotte, Mutual Friend, Thomas Williams, Carlle Silsberg, and Filed Addison. Wilkins, Emily Silsbury, and Ethel Addison, all good. Mr. STREEDWICK Was 3rd.

Set Hapanew blooms, one variety. Mr. (Streedwick, St. Leonir-Us, was a good lst with Churles Davis; Mr. C. A. Will-KINS, Swanley, coming 2nd; and Mr. Susbury, 3rd, with

Endly Silsbury.

Single hunded gardeners. With twelve incurved blooms, Mr. W. WHERTS took 1st place, with fair specimens; Mr. W. H. APTHORNE being 2nd; and with six blooms, the positions were reversed, Mr. APTHORNE being 1st; and WILKINS 2nd.

Mr. Apthornehal the best six Japanese, including Mutual Friend, Phoebus, Charles Davis, &c.; Mr. Etwards, of Cambridge, coming 2nd

Put Plants (open).—Although there were many fine trained specimen plants, almost the whole of them were of those shown on Tuesday, and there can be no need to recapitulate their names.

trained specimens Mr. J. Brooks, gardener to W. REASOLDS, Esq., Highgate, was placed 1st, his plants being capitally flowered. Mr. D. Donald, gr. to G. Barclay, Esq., capitally flowered. capitally flowered. Mr. D. Donald, gr. to G. Barclay, Esq., who also had grand plants, was 2n; and Mr. Divey, gr. to C. C. Paine, Esq., Stamford Hill, was 3rd. Mr. Donald had the best six standard plants, large flowered; Mr. Davev coming 2nd. Mr. Dovavo was again 1st in the six trained

Pompons, Mr. Brooks being 2nd.

Mr. Dyvey had the best four trained standards, and Mr. DONALD the best single spe imen, a perfect pyramid of La Vierge. TABLE DECORATIONS.

Table of Bouquets, Wreaths, Speans, etc.—There were four or more competitors in this class, each of which did his or her best to illustrate the decorative value of Chrysanthemum blooms.

to thus three the decorative value of Chrysanthenium blooms. Mr. H. C. GARFORD, Floral Depot, Stoke Newington, was the winner of the 1st prize: "Ind position was obtained by Messrs. HARWOOD BROS, Nurserymen, of Balham, and Mrs. W. GREIN, Jun., Harold Wood, Essex, was 3rd, but judged from any standpoint we think the last-named exhibitor should have been second.

Two cases of Chaysauth mams.—There were eight or more competitors for the best two vases of Chrysanthemums, blooms onsist of Pompon or Anemone Pompons arranged with to consist of Tompor of Anemore Francisco as Angelor to the foliage for decorative effect. The 1st prize was obtained by Mr. Mark Webster, gr. to E. J. Preston, Esq. Kelsey Park, Eeckenlam. In these there was no use at all made of Anemore Pompons, but Midle. Elsie Dordan, and other Pompons were used with various-coloured foliage to much effect; 2nd Mr. A. Meridew, gr. to Dr. Paul, Camberwell House, Camberwell ard Mrs. W. Ghren, Jr., Harold Wood, Essex.

On Pass.—The best wase of six blooms of any variety of

Japonese Chrysonthemum, arranged with foliage, etc., from Mr. R. E. Wilson, 22, Margravine Gardens, West Kensington; blooms of Viviand Morel were those used, and vase was drived gracefully with elegant Smilix; 2nd,

Wr. Ep Jones, 51, Bower Street, Bedford.

Lata Class.—Ladies were encouraged to compete in a class for a hand basket of Chrysanthennums suitable for a drawing-room table, and arranged with foliage. The victorions lady was Miss E. Pentrey, Vale Cottage, Hancer Hill, Edinz, who had apparently made free use of the

market variety Source d'Or; Miss Sengley, The Nurseries, Caterhan Valley, who was 2nd, eschewed all varieties but Viviand Morel, all of the flowers being fairly well coloured ones. 3rd, Mrs. W. Green, Jr., Harold Wood, Essex, who had

ones. 3rd, Mrs. W. Green, Jr., Harold Wood, Essex, whohad evidently carried out the idea that variety is charming. Two Hand Bouquets of Chepsenthenwans—Several of these exhibits were in exceptionally good taste. Mr. Mark Webster, gr. to E. J. Preston, Esq., Kelsey Park, Beckenham, who had ist prize, having two very elegant bouquets, indeed. The 2nd prize was taken by Mr. ARTHUR PENENEY, and the 3rd by Mr. W. Salmon, Ivy Cottage, Elder Road, West Norwood

STEYNING CHRYSANTHEMUM.

OCTOBER 28, 29, -A pleasing and successful exhibition was held at this town on the above date. Although this is only the fifth year of its existence, the Society has almost doubled its membership.

The 1st prize and the National Chrysanthemum Society's Medal went to Mr. C. Knowles, gr. to the Rev. Prebendary C. W. A. Nafier, Wiston, who had a well-grown and arranged C. W. A. Napier, Wiston, who had a well-grown and arranged group. Mr. G. Hart, gr. to Mr. Hean, Shoreham, was 1st for three specimen plants; for a single specimen; and he was 1st for twenty-four blooms of Japanese, receiving also the National Chrysinthemum Society's Medal for the exhibit; he was also 1st for twelve incurved varieties. Mr. J. Strepwick, Silverhill, Hastings, was 1st for twelve blooms of Japanese varieties; as was likewise Mr. R. Barting, Henfield, for six of thes; varieties.

The local Challenge Cup, given for the best twenty-four blooms of large-flowering, in not less than twelve distinct varieties, was won by A. Slaudhter, Esq., Jarvis Villa, Steyning, who now retains it, as well as a National Chrysanthemum Society's Silver Me lal. This was a bright and fresh stand of blooms. The division open to ladies only, resulted in keen competition. Miss K. White was 1st for a wellarranged bisket; Mrs A. White for a shower bouquet; Mrs. A. Slavohter for a vise filled with Chrysanthoniums; and Miss K. White again in front for an epergne. We have seldom seen a prettier and better arranged show, or one where the plants and flowers were of so superior a character.

TORQUAY AND DISTRICT GARDENERS' ASSOCIATION.

October 28.—The president, committee, and members of the Torquiy and District Gardener? Association are to be congratulated on having arranged the most successful thrysanthemum exhibition held in Torquay as yet.

As is usually the case in Torquay, the nurserymen contri-As usually the case in Torquay, the nurserymen contributed largely. The display of Mr. W. B. SMALL of Torquay was one of the brightest, and most tastefully arranged in the hull. It consisted chiefly of well-grown Chrysinthemums, amongst which were many of the newest varieties, including a fine white Michane Carnot, Mutual Friend, Edith Tabor, a yellow incurved Japanese; Belle Arlesienne, cramy pink; Charles Davis, a bronze-yellow; Col. W. B. Smith, terra

Charles Davis, a bronze-yellow; Col. W. B. Shatth, terra cottat; Director Kowallek, a grand purple-violatineurved; King of Chrysanthemuns, Indian red and old gold, &c. Messrs. R. Verren & Sors of the Royal Nursery, Exeter, exhibited close on thirty dishes of Apples of greatment, as well as Orchids, Princulas, Carnations, Cannas, Violats California, Princess Beatrice, and Princess of Wales, the winter-flowering Begonia, Gloire de Lorraine, and a number of interastic most areal abine plants.

number of interesting rock and alpine plants.

Mesers, Corris, Sanford & Co,'s choice general collection included Chrysanthemums in variety, Palms, Heaths,

metaded Carysanthemums in variety, tools, reason, Primulas, Bouvardias, Crotons, &c.

Mr. W. Athward sent some very hands one Ferna, amongst them being the new Pteris Wimsettin, and fine specimens of crosted Pteris and Nephrolepis, as well as Chrysanthemums, P durs, Cyclamens, Primulas, and which together made an attractive display. The management of the South Devon Fruit Parm sent a fine lot of fruit, which comprised some fine bunches of Museat and Gros Colmar Grapes, Tomatos,

Apples, and Mishrooms, very duntily arranged.

Mesers, Jahman & Co.'s (Chard exhibit, consisted of about try dishes of Apples, some extraordinarily fine Petatos, and

some equally fine Onions.

Mr. G. Pevece, of Torre, is well known in the Borough for the superior quality of his products as a market gurdener, and his collection at the Bith Saloon did him great credit.

and his collection at the Bath Saloon d d him great credit. It was well grown without being coarse.

Mr. Wells, murseryman, Redhill, Surrey, contributed a box of splendidly grown blooms; and Mr. Isave House, Bristol, specimens of the new gimt Violet Califorma.

Amongst the homorary exhibitors were Miss Laveus, of Upton Leigh, and Mrs. Wilson, Luneville, Mrs. Rawson, Bramhope; Dr. W. Ford Election, specimen plants of Begonia "Gloire de Lorraine;" Mr. W. Bushby, Torwood, Mr. C. Kirson, Collaton, and Mrs. Travor Byrechy. All their exhibits were highly commended.

The cut flowers generally were exceedingly good, both in

The cut flowers generally were exceedingly good, both in size, colour, and substance. The Japanese blooms were un-

size, colour, and substance. The Japunese blooms were undoubtedly the most meritorious, the incurved being, perhaps the weakest section in the remarkably strong classes. The incurved appear to be less appreciated than formerly.

The groups were remarkable for the closeness of competition; they were beautifully arranged, and anyone with any knowledge of Chrysinthinams and grouping will support the judges in their awards. To give visitors an idea of howear triends errors the Atlantic achibit their Chrysanthe-

mums, there was a class for cut flowers to be shown with their foliage, in vases. There were three entries in this class, and the blooms in old blue Oriental vases were, in our opinion, a long way in advance of those shown in boxes, although the individual blooms might not have been quite as large.

In the evening a lecture, entitled "The Chrysinthemum at Home and Abroid," was given by Mr. F. C. SMALE before a crowded attendance. The lecture was illustrated with some unique and beautiful lantern-pictures, prepared for the purpose, the photographs having been taken by Mr. S. Bretton, from a rire collection of water colour paintings from Japan, pictures from America, France, and other places. Mr. Smale dealt with the pictures, first describing the system of Chrysunthemum growin; in the home of the flower—Japan. Many specimens were shown on the screen hitherto unknown in England, some extremely pretty and graceful, and others which English people would not graceful, and others which English people would not altogether admire, but nevertheless floral novelties. The Chrysanthemum in America was then dealt with, the lecturer pointing to the advantages and disadvantages of exhibiting flowers in vases, as is the rule in the United States. He said more graceful effects were obtainable, and the foliage could also be shown, but it involved injury in packing the flowers, especially if they had to be exhibited at a distance. Nevertheless, the pletures of American exhibits in drinry wases proved conclusively that the Chrysanthemum could be made much more attractive in exhibits in dainty vases proved conclusively that the Chrysan-hemum could be made much more attractive in that way than when placed on the usual green exhibition box. Mr. Smale then proceeded to deal with the Chrysan-themum in France, the collection of Mr. Jones, of the Ryseroft Nursery, and that of Messrs. Pearson of Nottingham. Not the least interesting feature of the lecture was a description of the pests which attack Chrysanthemums, illustrated according to the Lugasse idea. according to the Japanese idea.

ASCOT.

November 4, 5,-In the Grand Stand the Angual Exhibition was held, and it was in every respect a succ ss. Unt blooms were the feature of the show. Mr. J. Salter, gr. to T. B. HAYWOOD, Esq., Woodhatch, Reigate, won the premier award for both incurved and Japanese varieties in each case, for twenty-four varieties, the blooms being of high quality.

In the incurved section, Mr. Neville, gr. to F. W. FLIGHT, Esq., Twyford, Winchester, secured the 2nd award; while Mr.

Esq., Twyford, Winchester, secured the 2nd award; while Mr. T. Denne, gr. to N. S. Cookson, Esq., Binfield Park, Bracknell, occupied a similar position in the class for Japanese. For twelve incurved, Mr. F. Hereman, gr. to Lady J. Keane, Rosenount, Sunningdale, won the premier position, In a similar class for Japanese, Mr. Wilson, gr. to R. C. Chursty, Esq., Ribsdon, Bagshot, was the chief prize-winner. Mr. W. Lane, gr. to Miss J. Duennor Smirn, King's Ride Ascot, won easily the Hon. Mrs. Ashley Ponsonny's Silver Cup for the best incurved and Japanese blooms in eighteen virieties. To this collection was also awarded the Brown virieties. To this collection was also awarded the Bronze Medal offered by the National Chrysanthemum Society, for Medal offered by the National Chrysanthemum Society, for the best exhibit of Chrysanthemums in the local classes. The promier Japanese bloom was Madame Carnot, in Mr. NEVILLES stand. In the incurved section, Charles Cartis received a similar recognition, this also belonging to Mr. NEVILLE. Mr. Laxe had much the best exhibit in the class for a collection of Chrysanthemums grown in pots, which were dwarf yet carried good blooms, accompanied with satisfactory leaf-grow. Mr. Laxes had the best exhibit of Chrysanthemums grown in pots, which were dwarf yet carried good blooms, accompanied with satisfactory leaf-grow. Mr. T. Daven had the best grown of Chrysanthemums.

age. Mr. T. Dinne had the best group of Chrysanthemums, interspersed with foliage plants and Ferns. Mr. W. L., Farmer, gr. to H. P. Leschallas, Esq., Higham, Windlesham, occupied a similar position, with a group of miscellmeous plants. Many other creditable exhibits were stiged in the writing section, over the property of the proper in the various sections, space however, forbids further details.

Obituary.

MRS. HEAL.—The many friends of Mr. John Heal, of Veitch's Nursery, will, with sorrow and deep sympathy, hear of the death of Mrs. Elizabeth Heal, who died on the 31st ult., at the age of fifty-four.

ENQUIRY.

"He that questioneth much shall learn much,"-BACON.

We have received letters from two correspondents, one living in the Isle of Man, and the other in Scotland, who are desirous of information regarding the raising and planting of Blaeberries or Bilberries on moorland. Should the seeds be sown and the young plants brought on in a nursery, planting them out when of a size likely to succeed among other moorland vegetation? In one of the cases, the woodland is "full of them," but none is on the moor. There are sheep to contend with here. Perhaps some of our readers will supply the needed information.

Araucaria in Ill-health: J. C. Beyond affording fresh soil to the loots at their extremities, and over the entire area in the possession of the roots, there is nothing that you can do to restore the tree to health. The splitting of the bark is simply the result of growth in the stem, and would occur in any case, although it would be more apparent in a droughty summer, followed by a wet autumn.

BOOKS: Geo. C. The Curnation, its History, Properties, and Management, by E. S. Dodwell, Derby; W. Bacon, Becket Mill Works.—R. M. Les Engrais is published in the French language by Messrs. Rueff & Co., 106, Boulevard St. Germain. We do not know the price.

Early White-Flowered Iris: R. V. II. Iris Bakeriava, which has white falls, also some forms of liberica, I. xiphium var. Blanche Fleur, I. xiphioides var. Mont Blanc, and others of this section, all of which force well. There are white varieties of Iris olbiensis, and an early-flowering species, growing to the height of 1 foot; I. stylosa alba is very early in flowering. These mostly flower in the mouth of April, but they can be hastened by gentle forcing. No forcing may be done if the plants are not well rooted in pots. They will do well in warm situations, especially suitable heing a place at the foot of a wall. We have no experience of planting them out in a Tomato-house, but should suppose that they would succeed, provided they had a light position, and are not forced severely.

Moss on Lawn: IV. C. The growth of moss may be due to lack of drainage, or to tree-shade. If it be the former, means should be taken to drain the land by means of underground drains, which, if trees and shrubs are uear, should be made of stones broken Macadam wise, and laid in V-shaped draius to the depth of 9 inches; pipes are no use, as they get stopped by the roots. Having doue that, scratch off the moss with a rake, and give the lawn a dressing of loam and fine wood ashes at the rate of six of the former to one of the latter, and on this dressing sow lawn grass seeds. The dressing and sowing will be best done in the spring, it being now too late. Rake in the seeds lightly and roll the surface when the soil is dryish, and does not stick to the roller. An annual dressing of wood-ashes and a triennial one of loam will keep the lawn in good condition, bare places being restored by sowing seeds. If you like, Trifolium repens and T. minus may be sown with the grasses, these plants covering the ground quicker than the grasses. They die out in great part in a few years, by which time the grasses have spread over the entire surface.

NAMES OF FRUITS.

The applications to name fluvers, and especially fenits, ace so innervus at this season, as second to hamper us in the series of one eddarral dutas. Then ential an expenditure of time, labour, and money, of which our residees have lattle idea. We are indeed edistrous to oblige our correspondents as for as we can, but we must request that they will observe the rule that not more than six varieties be suit at any one time. The specimens should be cond one, inst approaching express, and they should be properly numbered, and carefully packed. We do not undertoke to send auswers through the post. Delay in any case is an vondable.

Drummond & Sons, Your Apple is named Rymer

Drummond & Sons. Your Apple is named Rymer syn. Newbold's Duke of York.—Constant Reader. 2, Pine-apple Russet; 3, Winter Quoining, or Duck's-bill; 4, Royal Russet; 5, Sturmer Pippiu; 6, Cox's Pomona; 7, Adams' Pearmain; 9, Golden Noble; 10, Cornish Gillitlower.—Fulfords.—Pear, Belle de Bruxelles; 1, not known; 2, Yorkshire Beauty;

3, Cockles.—W. A. C. 2, Beurré Diel; 6, Marie Lonise; 15, Nonveau Poiteau; 12, Beurradte d'Esperen'; 16, Maráchal de la Cour; 7, Beurrá Charneuses. There were two Pears numbered alike, 13, the melting fine quality fruit is Doyenné du Conice, the other, not melting, is Catillac.—Carter, Paye & Co. 1, Apple, Fearn's Pippin; 2, Duchesse d'Angoulème; 3, Beurré d'Aremberg.—W. B. 1, Besspool; 2, not known; 3, Hornead's Pearmain; 4, Beauty of Kent; 5, Hawthornden; 6, Sturmer.—H. W. 4, Beurré Rance; 21, Beurré Bachelier; 10, Passe Colmar; 24, Beurre Charneuse; 20, not recognised.

Names of Plants: Currespondents not answered in this issue are requested to be so good as to consult the following number.—J. B. J. Begonia Ingrami.—J. Enfield. 1, Cheilanthes hirta; 2, Elæagnus pungens variegata; 3, Lomatia silaifolia, Rot. Mag, t. 1272; 4, Pittosporum variegatum; 5, Leucopogon Cunninghami.—F. W. B., Burnley. It is impossible to give the correct name of the shrub without seeing flowers.—S. L. 1, Pteris Busei; 2, Cypripedium conanthum superbum.—W. T. J. The decay of the Calanthe spikes is most likely brought about by a check wrought possibly by a sudden fall in the temperature. Sometimes the spikes will decay by injudicious use of liquid manure.—C. Want. Stapelia variegata.

Paullinia thalicirifolda: Paullinia. Take cuttings of ripened shoots and insert in pots of sandy soil cased with sand under a bell-glass in a bottomheat of \$0^\circ. The more suitable time is March and April, just when growth is on the move. Layering can also be done, if only a few plants are required.

QUICK-LIME IN TOMATO HOUSE: R. V. H. It may be laid on as top dressing, \(\frac{1}{2}\) to \(\frac{1}{2}\) inch thick. There is no necessity to bury it more than a few inches, as the water afforded the border will continually carry it downwards.

STORING DESSERT APPLIS: Ewquirer. There is no mystery about storing Apples, either desert or culinary varieties, if the following points are observed; and what suits the one is good for the other. The fruit should be very carefully handled when gathered and put into the fruit room; it should be put in one, or for culinary varieties two layers; air should be given till there is no more "s veating" observed, and afterwards the room should be kept dark and close, air being afferded occasionally to dissipate moisture. The best sort of fruit room is one that is partly under ground, if the land is well drained around it; it should have either 14-inch walls or double walls, that is, two walls of 4½ inch brick work with a 6-inch space between. The roof should be of thatch or tile—if the latter, there should be a boarded or plaster ceiling, and there should be an outer and inner door. fruit should lay on shelves made of battens about 2 inches wide, or on trays of the same kind of construction, which can be pulled out and are convenient. The temperature should be between 35° to 40°. Before fruit is stored the room should be sulphured by burning 1 onuce of sulphur in a saucer, with the doors closed, and the walls after-wards lime-washed. Never leave decaying fruit or mosty hay or straw in the room, or place the fruit on either, although brown or white paper are permissible. A fruit room of this kind will answer equally well for Pears, Nuts, Medlars, Quinces, for returding or keeping for a time store fruits. Pineapples, and Melons. Any Pears, however, which are approaching ripeness, should be placed, a few at a time, in a warmer place—say with a temperature of 50° to 55, whereby their flavour is much improved.

Tomato Leaves Diseased: R. Von der Heyde. It is Cladesporium fulvum. To the Tomato mould so often alluded to, and first described in the Gardeners' Chroniele. M. C. C.

JARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Position .- Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS .- In many instances Remittances in Payment of Repeat Adver-tisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting

to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. G. COVE, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

411 Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements. 41, WELLINGTON STREET, STRAND, W.C.

W. ICETON'S, Putney, S.W.

CHRYSANTHEMUMS.

OUR YEARLY INCREASE in the sale of both Plants and Cuttings arises certainly from the fact that all varieties (1400) are planted out and grown in open pure country fields, cut down early, not allowed to flower, large clumps removed, and replanted near the glass and light. Stock from these are perfect, and the secret why all those we supply carry success wherever they go, striking easily, growing quickly, and producing larger flowers. As a proof, they have made Mr. Meanet the Champion of the Champions.

We cordially invite all to

"COME AND SEE"

the oldest, finest, and best kept collection in the world. Splendid illustrated CATALOGUE post-free to coming customers. A list of all varieties exhibited at the last Aquarium Show free.

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 14, 1896.

THE ROSE GARDEN IN AUTUMN.

THE season which has been so unfavourable to the rosarian has continued its evil character far into the autumn; in previous years growers have been generally able to gather a fair quantity of Roses (of course in proportion to the number of their plants) till towards the middle or end of November, but these have been mostly from Tea Roses, which certainly descrive much more the title of Perpetual than the class that bears that name; but the deluge of rain with which we have been visited during the last two months has seriously damaged our hopes in this respect. During the months of September and October we have had here (in East Kent about 13 inches, and as our average for the year is about 26 inches, it may be well imagined in what a water-logged condition the ground is, and how sappy the wood is; so that should sharp frost come, the effect will be very serions. As I always pruno my plants at this season-by pruning I mean the cutting out of old wood so as to give the plants more air and sunlight-I think this is a season in which the practice will tell more favourably than in some others; it will be very difficult for the wood to ripen, but it will have a better chance of doing so under such conditions.

It will now be desirable, as soon as possible, to fill up vacancies, and to make new plantations where necessary. The number of new varieties is not very great, but there are some of the older sorts which the grower may desire to dispense with and substitute new ones in their place, although the result of our shows this season leads us to question very much whether we shall be justified in so doing; when we see such old flowers as Duchesso de Morny gaining the Medal at the great National show as the best H.P. But the following Roses, which have been tabooed by the Catalogue Committee of the National Rose Society, and will, therefore, most likely not be found in their next edition, may, I think, be safely dispensed with: -In II.P.'s, Devienne Lamy, Madame Lacharme, Marie Cointet, and Mrs. Baker; in Teas and Noisettes, Bouquet d'Or, Elise Fugier, Madame Berard, Mons, Furtado among exhibition Roses; among garden Roses, H.P.'s Bruce Findlay, Comtesse Cecile de Chabrilland, Henri Ledechaux, Maréchal Vaillant, Miss Hassard, Mrs. Harry Turner, Princess Mary of Cambridge, and William Warden; in Hybrid Teas Lady Henry Grosyenor, and Sonyenir de Wooton; and among Teas and Noisettes, Emilie Dupuy, Goubault, and Luciole, although there are some of these that growers who have walls or fences may like to retain, such as Bouquet d'Or and Madame Bérard.

: Of the new Roses the following may, I think,

be safely recommended as I think likely to prove valuable, some for exhibition, and some for gardening purposes. Amongst Hybrid Perpetuals, Captain Hayward, which has been exhibited in such good form by Mr. George Mount and others this year, that any doubt as to its being sufficiently full can no longer be entertained; Clio, Helen Keller, Marchioness of Londonderry, Mrs. R. G. Sharman Crawford, which promises to be a formidable rival to Mrs. John Laing; amongst Hybrid Teas, Charlotte Gnillemot, Marquise Litta, Mrs. W. J. Grant; and amongst Teas and Noisettes, Maman Cochet, Muriel Grahame, and Sylph.

Of garden Roses, the following will, I think, give satisfaction:—Lord Penzance, Lady Penzance, Flora McIvor, and Jeannie Deans, the best of Lord Penzance's Hybrid Sweet Briars; Crimson Rambler, Paul's Carmine Pillar (single). Marchieness of Lorne, Clara Watson, Duke of York, Alister Stella Gray, Beauté Inconstante, G. Nabonnand, and Madame Pierre Cochet.

I think that this list will include the most reliable of the new Roses; there are some others which promise well, but we must wait awhile until their merits are better proved.

Another subject that must engage the attention of Rose-growers is that of mulching: there are two ends which are sought to be gained by this, the protection of the plants against frost, and the giving of nutrition to the roots. The practice amongst those who exhibit Roses is to mulch heavily at this season of the year those plants from which exhibition Roses are intended to be cut, and there are various excellent reasons given by those who advocate and those who oppose the practice; but as the practice seems to be almost universally adopted, I presume that I may recommend that it should be doneit is my own plan in my small way, and I see no reason to regret it. This very wet autumn makes it, I think, the more necessary, for the shoots are so full of sap that they will suffer generally from hard frost if we get it. It is a good plan before putting on the manure (which I do not think should be too short) to draw some earth round each plant, and then place the manure over this; but I hardly know how in the present condition of the ground this is to be done, and if we wait much longer the frost may catch us before we are aware of it, and therefore as soon as we get anything like dry weather the operation ought not to be retarded. I remember once an eminent resarian recommended leaves as a protection, but I tried them and found that the first high gale scattered them all over the garden; others recommend encasing Tea Roses in straw envelopes, but as this is calculated to encourage premature growth I should certainly not recommend it. Moreover, one does not care about protecting the upper growth of even Teas, for when pruning takes place in the spring all this is cut away, therefore so long as the collar of the plant is secured from frost it will be safe, as strong shoots spring up about or near the base, and will soon fill up the bed. In what I have said now about protection, I have had in my mind dwarf plants only, as the great majority of the plants grown by amateurs are of this character. When standards or half-standards are grown, I think the better plan is always to put some light material, such as bracken, among the growth, but it is very difficult; in severe frost to preserve them in any way, and I have seen more than once whole quarters of most promising plants completely destroyed

regard to Roses upon walls, a different course is to be adopted; most of these are grown on walls facing south, and they are exposed to great variations of temperature when there is much sunshine. It is therefore desirable to cover up the whole plant with matting, or some other material, which can be removed from time to time when there is no risk of frost, because it is not desirable that the plants should be made tender by over-much care.

There is one other subject about which some amateurs 're anxious at this time, namely, that of obtaining stocks for budding next year; those who want to grow standards or halfstandards will be on the look out for the Briar. man, and will make incursions into the neighbouring woods and hedgerows for the purpose of obtaining plants of the Dog-rose. Those who wish to grow dwarfs will probably not care to take the trouble of making cuttings of the Manetti or Briar, but will obtain their plants of both these and the seedling Briar from some neighbouring nurseryman the sooner the better, now-and when obtained. they should be planted in shallow trenches, so that they can be more easily worked by-andby. If space be not a matter of too great consideration, better to give room to the plants, putting them 6 or 8 inches apart; this will be better both for the grower and the plants themselves. All these operations will, of course, be retarded by such weather as we are new experiencing, but it is far better that it should be so than that they should be carried out when the ground is in an unsuitable condition. Wild

BASING PARK, HANTS.

What seems to be in these days of quick railway transit, a sort of out-of-the-way rural district, just such as a light railway might most efficiently serve, is all that portion of East Hants which lies between the Alton and Winchester, and the direct Portsmouth railways of the South-Western Railway Company. For somewhere in the centre of this district lies the charming estate named Basing Park. It is a neble place, not to be confounded with Basingstoke. This park is the residence of W. Nicholson, Esq., is situated about midway between Alton and Petersfield, being nearly 9 miles from each, and it is not unknown to gardeners, because the head gardener, Mr. W. Smythe, now one of the patriarchs of his profession, is very well known to a wide circle, and has been there some twenty-one years. He has often wielded his pen effectively as a contributor to the Gardeners' Chronicle. The mansion which has a fine bold frontage, looking from an elevation over much charming scenery, is flanked at one end by a fine conservatory, 70 feet long, and in the centre 25 feet wide. It is furnished with Palms, Ferns, Camellias, Fuchsias, Abutilons, indeed flowering and foliage plants in great profusion, giving to the large area a very gay aspect, whilst from the roof hang Tacsonias, in diverse colours, and in rich profusion. These climbers were chiefly from a batch of seedlings Mr. Smythe raised seventeen years ago. Hydrangea Hortensia, both blue and pink, were flowering profusely. It was mentioned that the blue tint was obtained by giving the plants occasional waterings with alum solution. Outside, the lawn slopes away gracefully, and upon it are many fine trees; especially good are various Conifera, Sequoia gigantea, 75 feet high, and with a huge bole, 3 feet from the ground, 14 feet 6 inches round. Araucarias are very fine, so also Sequoia sempervireus, Cryptomeria japonica elegans, Cedrus Deodara, Abies Nordmanniana, and Abies Lowiana, fruiting finely, &c.; also Weeping Beech, and many heautiful trees. In this respect the place is undoubtedly rich. Shrubs also thrive luxuriantly, notwithstanding the nearness of the chalk. In a secluded spot a large hardy fernery makes a very interesting garden feature.

Parterre bedding is modestly done, but not close under the windows, where a broad expanse of turf seems to be most appreciated, but somewhat remote. A special feature was Basing Park Begonia, raised some years since by Mr. Smythe through crossing B. Weltoniensis with one of the large-flowered tuberous varieties. The plants grow 20 inches in height, bloom profusely, having pendent flowers of a magenta hue, and are remarkably persistent, whilst it quite defies harm from rain. In every direction the extensive pleasure-grounds are full of interest, and are admirably kept.

The glass-houses are extensive. One unheated orehard-house is 300 feet long and 12 feet wide; this structure has the back wall covered throughout with Peaches, Nectarines, Apricots, Plums, and Figs. Plums, cordon-shaped, are trained up the rafters. A low wire-arched trellis the whole length is covered with Peaches, Nectarines, Apricots, &e.; and behind are semi-bush Pears and Plum-trees. All these crop heavily every year, and the produce is immense. Certainly it is here a most valuable orehard-house. Grapes are largely grown in a range of six houses, each about 35 feet long, and 15 feet wide. The earlies are filled with Hamburghs and Foster's Seedlings, planted over twenty years, and still doing well. The crop was ready the first week in May. Then comes a house of Muscat of Alexandria, Madresfield Court, and Alnwick Seedling, with good crops. Then a longer houseful again of Black Hamburghs, Foster's Seedling, Raisin de Calabre, here very fine; and Gros Maroc. The fourth house is filled with Black Alicante and Gros Maroc, here much liked; the fifth is full of Muscat of Alexandria, a good crop; and the last is planted with Black Alicante, Mrs. Pince, Lady Downes, and Muscat of Alexandria, for later cutting. Then there are numerous plant, Cucumber, and Melon-houses, and Pine pits for these fruits, chiefly the Smooth Cayenne, which are well grown; and recently a useful addition in the shape of a range of span-houses for forcing purposes has been added. Very noticeable in one of the planthouses were seedling-plants of Clerodendron fallax from seed sown in February last, and now 20 inches in height, carrying huge leafage, and which will, when in bloom, have splendid trusses of scarlet flowers. Such plants, with Poinsettias, also largely grown, are most valuable for giving colour in the winter. As elsewhere, Tomatos have to be largely grown. Ladybird, a selection from Perfection, seems to be the favourite, for it is here an abundant cropper.

It is very interesting to note that outdoors, and especially on old trees, there have been heavy fruit-crops. Apples and Pears especially have been most plentiful, in spite of the poorness of crop elsewhere. The chief exception to this rule is found in a number of huge and exceedingly aged fan-trained Pear-trees, that, covering an arched trellis, form a leafy tunnel through the kitchen-garden, having beneath a broad walk. The trees seem now to be too old to be productive. In front of the great orchard-house stand some old stunted standard Apple-trees, kept specially for covering with the Canary Creeper in summer, when they form beautiful objects.

The kitchen-gardens have become somewhat dense with fruit trees, although some excellent vegetables are grown. Other ground in a large paddock has been enclosed several years, and now forms a fine vegetable garden, where everything seemed to be doing well. A striking feature of the place is a noble avenue of Araucarias, though, as is invariably the case with these trees, growth has not been even. It is noticeable that in some cases the male trees, easily distinguished from the females, by the denser character of their cone production, are the finest, and in other cases females are the strongest. Many of the trees, however, are very fine specimens. This avenue leads from the home-park to the fine new church lately erected by Mr. Nicholson, the spire of which now forms a notable landmark. Mr. Smythe is yet remarkably vigorous and energetic, and does his work wonderfully well. He does not get many visitors, but those who see the place will admit that its keeping does him great credit. A. D.

METHODS OF PLANT PROPA-GATION.

(Continued from p. 491)

PRIMULA SINENSIS.—This species of Primula, so wonderfully improved of late years by the florist in the variety and brightness of its colouring, and the size of its flowers, is rather a difficult subject to raise from the seed. The seeds are of a hard, horny nature, and require a long time to germinate, unless they are quite fresh. Indeed, a good rule for all the Primrose

Some gardeners do not use moss to cover the seed-pots, but employ a piece of glass or tile, the latter having its advantages, as it keeps the seed in darkness—a favourable situation for all seeds, and does not admit slugs woodlice, &c., which gnaw off the plants as soon as they appear, and the seeds being uncovered with soil are devoured, together with the germ. As soon as the seed is found to have germinated, the tile, moss, &c., must be removed, and a sheet of glass substituted, which may be tilted half an inch at one side, so as to afford ventilation to the

best for procuring flowers for seed aving purposes—present fewer difficulties, the seed germinating readily, and the dangers arising from insufficient ventilation, such as damping-off, and etiolation (drawing) are less; although the same care is needed in preparing the soil, sowing, shading, &c. These late spring sowings need not be made in a hot-bed, a temperature of 60° sufficing for germination; and during the summer greenhouse treatment, or such as is afforded by a cool-pit or gardenframe, suits the plant.

Fig. 103.—CLEMATIS MONTANA AND IRIS ACUTA, A SYNONYM OF SIBHROA ENTRY VR. S. LIRRY, HATCHID Chlory WITHAM IT F Square for the thematis white; and those of the line blue, and bright yields y income high ground

tribe, is to sow the seed as collected, using soil similar to that recommended for the Calceolaria, but coarser, and enriched by the addition of decayed cow-manure, passed through a fine-meshed sieve. The soil should be made firm in the pots or pans, and after sowing the seed, it should be afforded water copiously. The pots, &c., should be left to drain, and then covered with fine dry wood moss, or sphagnum-moss, so as to ensure a constant even state of moisture and shade, merely removing the moss from time to time to ascertain if small slugs, wood-lice, &c., or other creatures are to be found in it.

seedlings, and a slight amount of shade afforded during bright sunshine, and only then. If glass be used to cover the seed-pans at the first, it should be covered by a piece of brown paper or a little moss, removing it as in the case of the opaque coverings when germination has taken place. Suppose that the seeds were sown in warmth of 70 in February or March, preferably in a hot-bed, the seedlings must be removed in a week to somewhat cooler quarters, and be kept close to the roof-glass, and the glass covering the seeds should then be removed. Sowings in May—and these are the

Primula paponica, a fine perennial Primrose, introduced from Japan by Mr. W. Bull, is an excellent plant for the rockery or alpine garden. The crowns should be slightly protected with cocoa refuse or other like material in the winter. It is a difficult plant, however, to raise from seed, requiring usually great patience on the part of the gardener. I purchased some of the first plants distributed, and was fortunate in saving plenty of good seed, while I hybridised it with all the species of Primula then obtainable, including Himalayan forms, and P. sinensis, but was not successful in getting any hybrids. Six

panfuls of seed were sewn most carefully, and after waiting for twelve months for the seedlings, five pans were turned out, and one was left in an open pit facing north. The following antumn was rainy, and chancing to pass the pit where this pan stood, I was delighted to see the soil literally covered with seedlings of minute size. Therefore if you want to raise P. japonica, give it plenty of time.

All species of hardy Primroses are difficult to deal with. In these I include the alpine Auricula, but the seed of this species, if it be sown in shallow pans or boxes, and placed in a cold frame facing the east, will germinate freely, provided it is fresh; or the seed may be sown in shallow drills in the open ground, on a cool border any time from June to August.

Cyclamen.—This plant, though belonging to the Primrose family, has large, fleshy seeds, produced in seedvessels which, before maturing, project above the foliage, but later the peduncles twist themselves into a close spiral, bringing the ripening seed-vessels close te the soil, and no doubt in its natural habitat, into the soft soil or humus commonly found in shady places, when the seeds germinate. Let us take a hint from this, and prepare our pans or boxes by making the soil firm, then sowing the seed, and covering with sifted leaf-mould mixed with a small quantity of fresh loam. When the little corms have reached the size of Sweet Pea-seed, they should be carefully pricked out into boxes, avoiding thereby breaking or injuring the roots; water copiously, and shade for a day or wo. On no account permit the soil ever to get dry. Keep the plants growing freely in intermediate-house, and when they have developed five or six leaves, they may be potted into small 60's. The final shift into 48's should be made as soon as the roots reach the sides of the pot. The soil used for this shift should consist of leaf-mould one-half, and well-decayed cowdung; fresh loam, and a little sharp sand, forming the remaining half. June to August is the best time to sow seed of the Cyclamen.

The Begonia, so greatly improved and varied of late by the skill of Messrs. Laing, Caunell, T. Ware, and several continental nurserymen, has become a florist's flower, and plants, true to the characteristics of its parents, may be raised from seed with facility. The seed is best treated like that of the Calcolaria, a slight covering of sifted leaf-mould being given the seed when sown, and the sowing should be made in the winter or early spring. It is advisable to employ gentle heat in raising seedlings. If the seed was not sown very thickly, the seedlings may be left till the tubers have become as large as Peas, and then petted into 60's. These tubers, unlike the corms of the Cyclamen, may be allowed to dry-off in October or Nevember, and rested till the following spring, in a dry state. This is easily secured by laying the pots on their sides under the stage in the vinery, or other cool dry house, or preserving the tubers in flower-pots in cocea-nut fibre or sand.

The Streptocarpus, so wonderfully improved from the two old forms, S. nniflorus and S. Rhexi, is another subject which requires special treatment and skill to raise successfully, owing to the exceeding fineness and lightness of the seeds. This is produced in a twisted fruit or pod, from which the genus takes its name. Prepare your box or pan as for sowing the seed of the Begonia, then pour the contents of the seed-packet on to a white card, and with the end of a lead-pencil or a camel's-hair pencil push off the seed a few at a time on to the moistened soil, covering it slightly with finely-sifted leaf-mould and silver-sand. Put a bell-glass or piece of glass over the pans, and plunge half-way in gentle hot-bed. Remove the glass from time to time, and wipe off the moisture, or it may cause damping-off. As soon as large enough to haudle, prick off the plants into boxes or largo pans, shading them for a day or two, and then afford plenty of light and gradually more and more air. Do not let the plants crowd one another, but pet them into single pets as soon as their leaves touch each other, shading them from the direct rays of the sun for a while, and letting them flower in the small pots first, when the poor forms can be weeded out and the good ones potted on.

Ericas may be easily raised from seed sown on the surface of lumps of sandy peat dusted over with fine silver-sand, and then covered closely with a bell-glass; but the soil and saud should be thoroughly sterilised by being baked in an oven, or the spores of moss and Liverworts, almost always present in surface-soils, will germinate and rapidly choke and kill out the little Erica seedlings. Every gardener knows that seed, taken from a florist's variety, will not often produce the same exactly, there being a constant tendency to revert to the original type; but this should make propagation by means of seed the more interesting, as there is always the hope that some good novelty may arise. Experience.

(To be continued),

CLEMATIS MONTANA, ETC.

ON p. 589 is an illustration (fig. 103) that has been re-produced from a photograph kindly furnished by Mr. S. Kerry, Hatfield Priory, Witham, which shows the pretty decorative effect produced by the easily-cultivated floriferous Clematis montana. Most species of Clematis have the best appearance when but slightly confined by ties or trellis-work, and allowed to ramble at will; and our illustration shows a plant with its sheets trained on pieces of wire or string, fastened to a water-spout at the top, and at the bottom to the wall, or a strip of wood nailed to it. The border skirting the dwelling is planted with elumps of the very common Iris sibirica, a species with linear leaves, about 18 inches long, growing in tufts of five or six. The flowers have a lilac-blue limb, and falls much veined with bright violet on a light ground. There are many forms of the species differing in the colour of the flowers. Flowering as it does at the same time as the Clematis, the effect would, doubtless, be very pleasing.

BELGIUM.

In Brussels, at L'Horticulture Internationale, there are now in bloom a fine Cattleya Rex, C. superba, remarkable for exceptional brilliancy of colouring; Cologyne Massangeana, with ten floral racemes, the longest measuring over 27 inches; numerous species and varieties of Vanda are also in full flower; Oncidium Lanceanum is coming into bloom; there is a new importation of Oncidium, which contains exceptionally fine specimens.

MM. Lucien Linden et Cie., at Moortebeke, have some Cattleya labiata and Trianæi with wonderfully-luxnriant foliage, showing both good cultivation and good air. There are certainly at least 7000 or 8000 spathes of C. labiata which will be in full flower about the middle of November.

M. Stepman, of Messemacker, has some exceptional Asparagus Spreugeri coming largely into use for decorative purposes, and Cypripedium montanum covered with bud.

In the houses of M. FLORENT PAUWELS, at Deurne, near Antwerp, are some well-flowered plants of Odontoglossum bictenense; another variety of this species with large flowers with a purplish rose lip; Odontoglossum Roezli, with large flowers, newly imported; Vandas and Aroids; a curious Dendrobium crnentum, and Vanda suavis and tricolor. The Phalænopsis are still flourishing; many P. amabilis are notable for richness of bloom. Cypripediums do well, there are excellent varieties of C. Veitchi, C. grande, with three fine flowers; Epidendrum prismatecarpum, quite a mass of numerous blossoms; Acineta superba and Cattleya Pinelli. I neted also a cutting of Acalypha macrophylla more than 3 feet high, and with very large leaves; Nepenthes Burkei, with a dozen pitchers; Authuriums flowering well, A. Leeraer de Beucker, a good variety, is noteworthy for the abundance of its flowers. I would also mention thriving seedlings of Cypripedium and of Odontoglossum.

CHEMISTRY OF THE STRAW-BERRY-PLANT.

(Continued from page 490).

THE following table illustrates the average composition of the ash of the Strawberry-fruit when fully ripe.

Percentage Composition of the Ash of Strawberry-fruit.

						Per cen
Potash	,				***	41.07
Soda	***			4+4		8.48
Lime						14.51
Magnesi ı						1 '37
Iron oxid	e and a	dumi	11.1			5.89
Phosphor	ic acid					13:82
Sulphurie	acid	,				:: 15
Silica		•••		**	***	12.01
						100:00

These figures illustrate the fact that while the ash of the Strawberry-plant contains about 6 per cent. of phosphoric acid, the ash of the fruit contains nearly 14 per cent.; the average amount of potash in the four varieties of plants is 26 per cent., against 41 per cent. in the fruit. Dr. Goessmann, Director of the State Experiment Station, Amherst, Mass., U.S.A., has found that the constituent potash averages nearly 54 per cent. in the ash of Strawberry-fruit.

Soda averages but 1 per cent. in the plant, while in the fruit this ingredient reaches over 8 per cent. The lime is only about one-half as much in the fruit as it is in the plants, while magnesia ranges about 5 per cent more in the plants than in the fruit. The comparatively large proportion of silica and of oxide of iron and alumina in the ashes, both of plants and of fruit, are interesting from a scientific standpoint, but need not be considered here, as they are elements supplied in abundance by every fertile soil.

The quantity of Strawberry-fruit obtained per acre varies enormously, ranging from 75 bushels to 300 bushels, or even more. A good average yield of Strawberries will probably weigh 10,000 lb.

According to Pierre an acre of Strawberry plants (above-ground growth) and fruit, will consist of the following constituents:—

Constituent	ts.	Plants.	Fruits.	Total,
Dry substance		 Lb. 4268	Lb. 1054	Lb. 5322
Nitrogen		 89	16	105
Ash (mineral matter)	•••	 414	49	463

That is to say, 1 acre of Strawberry plants and fruit will require more than 2 tons of organic matter, 100 pounds of nitrogen, and nearly 500 pounds of mineral ingredients to sustain them during growth.

The same author quotes the ashes of the Strawberry plants and fruit as containing the following constituents.

Mineral Constituents derived from the Soil in the Growth of Strawberries, in pounds, per Acre.

Constituents.	In Plants.	In Fruit.	In Total
	 Lb.	Lb.	Lb.
Potash	 89-1	19:7	108.8
Soda	 6.4	0.0	7.3
Lime	 102.7	7:9	110.6
Magnesia	 16.1	0.7	16.8
Phosphoric acid	 37:3	5.4	40.7
Silica, iron oxide, &c.	 43.3	5.3	48.6
Other elements	 120:9	8.8	129.7
Total ash	 413.8	48.7	462.5

Of the essential elements, it is here made clear that the chief demands for the development of the Strawberry plant are upon the available potash and nitrogen in the soil. The phosphoric acid stands third, the ratio of potash to phosphoric acid being about three to one. Most fertile soils contain lime in a sufficient quantity for Strawberry culture without any artificial application.

In a plantation of Strawberries the plants are usually ploughed under at the close, thus returning the substances formerly abstracted and assimilated from the soil; the only real loss, theoretically, of plant-food, when this is the case, is that centained in the fruit.

The loss of plant-food that the soil sustains through the gathering of the fruit, is not, compared with some other garden crops, an excessive one. At the same time, it is to be remembered that the soil has to provide, in addition to those elements required by the fruit, the fertilising constituents as given in the foregoing table, though, as already pointed out, the greater part of the latter will eventually return to the soil (always provided that only the fruit is taken away).

A soil to be well manured must contain a large excess of available plant-food over and above the amount that can be utilized by the Strawberry crop, since it cannot be supposed that the roots will be able to absorb, by virtue of their disposition in the soil, more than a comparatively small proportion of such fertilising incredients.

The Strawberry is usually considered an "exhausting crop," yet, as far as the real loss of plant-food through gathering the fruit is concerned, the facts, looking at them superficially, scarcely bear out this opinion. To replace or restore to the soil the substances so removed by the fruit, would not in itself appear to require a very heavy application of manure. It is found, however, as a matter of practical experience that, to make Strawberry culture successful, the soil must be fed very liberally. High manuring for Strawberries is an essential condition for successful growth. We may advance several reasons why such is necessary, and why this practice does not conflict with what has already been said, and shown by the foregoing analysis.

The growing season is short, and more especially the fruiting period. During a comparatively brief time there is a large demand for immediately available forms of nitrogen, phosphorie acid, and potash, and especially in the first and last of these elements; a demand that must be met if the best results are to be attained. Even the richest soils cuntain only small amounts of such plant-food that is readily assimilable, and hence the necessity for the presence in the soil of a large quantity of manure that will easily yield up its fertilising ingredients. This is found to be the case more particularly when the rainfall during the fruiting season is below the average. Then the benefit of good liquid-manure, or of assimilable fertilisers applied in solution, is apparent. The amount and kind of fertiliser required depend very largely upon the season and the character of the soil. For pot-culture of Strawberries available plant-food is more especially needed, owing to the limited area for root-distribution. J. J. Willis Harpenden.

THE RUSTS AND MILDEWS OF CEREAL CROPS.

THE most important and the most comprehensive work upon the above subject has recently appeared under the title of Die Getreideroste.* The authors, Dr. J. Eriksson and Dr. E. Henning, have done their work most thoroughly, and are to be complimented on the completion of their painstaking investigations. That an octavo volume of 460 pages should be written concerning only six species of parasitic fungi, illustrated by twelve plates containing 143 coloured figures, would a few years ago have been considered impossible. The importance from an economic standpoint, however, of these parasites, has produced a good deal of literature; no fewer than twelve pages of the above work are occupied by an enumeration of the various books, memoirs, monographs, and papers on this subject which have appeared during the last 100 years in various parts of the world. The history of the Wheat-mildew dates from remete antiquity, but, of course, it is only during the last half century that its literature has become so alarmingly exten-The principal diseases, known as Wheatmildew and Wheat-rust, are due, as everybody knows, to less than half-a-dozen fungi. Of these, by far the most important is what we call, in England, Wheatmildew, or as the authors designate it, black-rust-Puccinia graminis, a parasite which attacks not only

Wheat but also Rye, and to a less extent, Oats, Barley, and various grasses. Every botanical student is now taught that this fungus passes one part of its life on the Wheat plant, and another upon the Barberry; but the authors have gone a step further into its life-history, and find the old Puccinia graminis to be a collective species. All forms of it have their æcidiospores on the Barberry, but the uredospores are not in every case capable of transmitting the fungus to all the species of grasses and cereals on which the Puecinia occurs. For instance, the uredospores taken from Rye readily enough infect healthy Rye plants, but are inoperative upon Oats and Barley; and those from Oats produce no effect when applied to Wheat and to Birley. From the result of a long series of cultures, the writers come to the conclusion that the old Puccinia graminis includes at least five different forms, namely. 1, Secalis, on Rye, Barley, and Twitch (Triticum repens); 2, Avence, on Oat: 3, Tritici, on Wheat; 4, Airæ, on Aira caespitosa; 5, Poze, on Poa compressa

We are at once met by the question:—Are these five distinct biological species, or are they only forms or varieties which have acquirel, so to speak, a taste for their respective host-plants to the exclusion of other gramine? a question easier a-ked than answered, for much can be advanced on both sides.

The next most familiar Wheat-disease is what we have been in the habit of calling Puccinia rubigo-vera—the early spring-rust. The authors have, however, shown that this really consists of two species, which they call the yellow-rust and the brown-rust. The yellow-rust (P. glumarum, Schum.) is well distinguished in its uredo stage by having its uredospores upon broad yellowish stripes on the leaves; by the individual sori being yellow, and the teleutospores principally confined to the leaf-sheaths and haulms, where they form minute black lines. Of this species, the acideal form is unknown. It is the more injurious to the Wheat-crop since it is apt to attack the glumes, and when it does, it distorts and dwarfs the kernel.

The brown-rust (P. dispers), Eriks, and Henn.) has its unclospores in scattered dark orange or yellowishbrown sori, its teleutospores are found mostly on the under-surface of the leaves, and its acidiospores occur on Anchusa vulgaris. The teleutospores of these two species resemble each closely in size, in colour, and in form, but, according to the authors, the promycellial spores of P. glumarum are yellow, while those of P. dispersa are colourless. Both germinate in autumn. During the present year (1896) both species have been observed in Norfolk, but P. dispersa has been by far the most abundant during July and September, although earlier in the season the uredo of P. glumarum was sufficiently common.

The next most important Puccinia is P. coronata, the crown-rust; it mainly affects the Oat-plant, and to us in Great Britain is economically unimportant. The authors also regard this as a collective species, having its acidiospores upon the two Rhamni, R. cathartica and R. frangula.

One half of the book treats of what the authors call the secondary causes of Wheat-rust and mildew. These couple of hundred pages have a much wider range of interest, as they appeal to the Wheat-grower rather than to the botanist. The influence of situation and drainage, the physical and chemical condition of the soil, the previous crop, the seed-corn, the mode of sowing, the influence of the weather, of the neighbouring vegetation, and the susceptibilities of the different varieties of Wheat, are all treated of in detail and at considerable length. With regard to the chemical constitution of the soil, the fact that potash favours the early ripening of the crop, while an excess of nitrogen delays it, is shown to be of importance, as in the former case the disease is retarded, while in the latter it is favoured. During the years 1890-93, 131 varieties of Wheat were tested at the experimental station near Stockholm as to their susceptibility to the three rusts before mentioned, and their respective disease-resisting capabilities shown in a tabular statement. At the same time, some thirty varieties each of Oats, Barley, and Rye were similarly examined, while such questions

as the influence of the number of stomata, and the thickness of the epidermis on the susceptibility of different varieties were carefully gone into. The last chapter is devoted to the various protective measures available for combating or preventing these diseases. Charles B. Plowright, M.D., King's Lynn, Nov. 2, 1896.

NOTES FROM THE ROYAL BOTANIC GARDEN, EDINBURGH.

RUELLIA MACRANTHA is a plant which should be grown wherever decorative plants are much in request at this season, nothing being more effective than a good number of this plant, each bearing large showy flowers. Several plants of this species have been flowering here in an intermediate-house for a long time. By means of a succession of cuttings struck at different times, plants of all sizes have been obtained, which range from 3 feet or more in height downwards. These plants will continue to flower for a considerable period of time.

Ipomore purga. — As a climbing plant for the greenhouse, Ipomore purge makes an extremely pretty show at this season. Although nearly, if not quite hardy here, its flowers are produced too late out of-doors to come to perfection. Here it has long survived in a cold frame, its long, climbing growths annually appearing in the spring. In the cool economic-house a plant is trained over the roof, and is opening its deep purple-coloured flowers, these appearing generally singly upon axillary peduncles, but this is compensated for by the large number produced, which, when observed against the shining-green glabrous foliage, have a pretty effect. It is the true Jalap plant, and is, perhaps, better known by its symonymous nume of Exogonium purga. It is a native of Mexico.

Animopaqua i racemosa.—Like the above plant, this is far from being a common one in gardens; it is, however, deserving of a place amongst the climbers grown in the stove. When established, the stems climb by strong tendrils to a considerable length. The foliage is of a dark-green tint, and leathery in texture. The racemes, which are axillary, carry a considerable number of light-yellow tubular flowers, of a hundsome appearance. Like most of the genus, it is a native of Brazil, and the best method of cultivating it is to plant it out in a border and train the growths under the glass, where thorough ripening can be ensured.

Myrtus Lumt.—A fine attractive specimen of this nearly hardy shrubby species is in full fruit at the present season. The berries are produced in great abundance, and resemble somewhat those of Black Currants, but they are borne in greater profusion. In a cool greenhouse it is well worth a place as a flowering and fruiting plant. This species makes a good companion to M. Ugni, with red fruit. Both are natives of Chile, and easily cultivated as greenhouse plants.

Theobroma cacao. — While mentioning fruiting plants, I must note the occasion of this, the "Cocoa plant," producing one of its large fruits in the economic-house in the gardens. The plant is a large one, and occupies a central position in the bed, and is about 12 feet high. Many attempts have been made to fertilise flowers without success, and the fruit the plant is now currying appeared just at the base of the stem, and is now nearly 4 inches long. Although of easy culture as a stove-plant, its fruiting is not a common occurrence.

Angreeum Scottianum. — A good plant of this species is now flowering in the Orchid-houses here, its spurred flowers attracting attention. The straggling terete stems usually hang over the basket-sides, thus showing more advantageously the pretty white flowers.

A. bilobam.—This is another pretty Angraeum now in flower. It is of small growth, with leaves about 4 inches long, deeply lobed at the apex, with brown spots upon the surface, and a brownish margin. The flowers are white, and upon the reverse of the sepals a browish tinge is noticeable, while the pedicels are also of that colour. The treat-

^{*} Die Getreideroste, by Dr. Jakob Eriksson and Dr. E. Henning (Stockholm, 8vo, pp. 463, with 13 coloured plates.)

ment found suited to this west tropical African plant, as well as to A. Scottianum, is a very warm moist temperature, with abundance of moisture at the roots.

Masdevallia cucullata.—This is a very distinguishable plant on account of its almost blackish-purple flowers, which are berne upon scapes singly, and appear amongst the foliage. The tail is about $1\frac{1}{2}$ inch in length, and yellowish-green at the tip. First discovered by Liaden in 1842, near Begota, it was not until 1883 that this species was successfully imported by Messrs. Shuttleworth & Co. In its native habitat it is said to be named "The Widow," perhaps on account of its sembre-coloured flowers. Where Masdevallias are grown this species deserves a place.

Barkeria elegans.—At this season of the year all flowers are welcome, and plants of the above are very useful for decorating purposes. The long racemes of whitish flowers, with a lip having a large reddisherimson blotch upon it, are attractive. Barkerias are said to be found upon low twiggy bushes, near water, in their native habitat, Mexico; and certainly the roots look as if such a medium to cling to would suit them well. R. L. Harrow, Royal Botanic Garden, Edinburgh.

CHRYSANTHEMUM CHAT.

(Continued from p. 558.)

CHRYSANTHEMUMS AT CHISWICK .-- It seems, and is indeed very appropriate, that at the garden of the Royal Horticultural Society the Chrysanthemum should be well cared for. Exactly half a century ago, Robert Fortune was sent to China by the Society on a plant-collecting expedition, one that resulted in his despatching to this country many hortieultural rarities, and amongst them were two small-flowering varieties of Chrysanthemums, grown and held in great esteem by the florists of the Island Towards the close of the year, one of of Chusan. these new flowers was staged at the Society's rooms in Regent Street, and named the Chusan Daisy, the first Pompon then introduced. But this is not, by any means, the Society's first record in dealing with the flower. At Chiswick in 1821, there were twenty seven varieties cultivated, and two years later the number grew to forty-eight. At the present time there are about 800 plants at Chiswick, representing over 400 varieties, the general condition of which reflect credit on the superintendent, Mr. S. T. Wright. To specify a tew amongst the many noted on a recent visit. Amongst the incurved may be mentioned: Empress of India, white, very large and fine. Lord Rosebery, long medium-sized petals, of a silvery-manve shade, lined white; never recurves, and requires no dressing. Miss M. A. Haggas, in this we have the long-looked for Golden Princess; it is a light golden yellow sport from Mrs. Heale, properly fixed. Mrs. G. Rundle may be justly described as the most beautiful white Chrysanthemum in cultivation. A new variety, named Alfred Lyne, is white tipped with pink. A fine addition to the incurved class is Mrs. Robinson King, deep gelden-yellow sport from Golden Empress. Robert Cannell, having large flowers, bronze red, with under petals distinctly gold-coloured, every petal broad and bold, a fine variety. Lord Wolseley, a sport from Prince Alfred; it resembles its parent in general form, but is larger, of more substance, and of a bronzy hue-distinct, and good. Good also were Baron Hirsch, D. B. Crane, Jeanne d'Arc, Mrs. James Murray, and Lord Alcester.

The Japanese varieties form a good selection. We may specially note, perhaps, the finest in this section yet introduced:—Edwin Molyneux, colour deep rich maroon-red outside, petals when expanded of the richest golden tint; petals immense, both in width and length. Beauty of Exmouth is a heautiful variety, the blooms, pure ivory-white, are large, with a very refined appearance; petals of good substance, gracefully curling and twisting. The well-known Avalanche, white, is quite worth a note; and the old White Elaine is still good. President Borel, rosy purple; Mrs. E. G. Hill, clear pearl-pink. A useful exhibition variety is the new Herbert J. Cutbush, a

unique flower, with long petals, of medium width; eolonr deep red, heavily striped yellew. William Seward, a magnificent deep rich blackish-crimson flower, florets exceedingly long, resembles in shape Sunflower; the florets, however, are firmer, and the whole flower considerably heavier. Duke of York, one of the finest in this section; the colour of the reverse of the petals, which is the principal part seen, is of a deep pink ground colour, heavily shaded bright silver - a decided acquisition. A beautiful white is Madame Carnot. The old but still good James Salter, delicate pink, is by no means to be despised; and the same remark applies to Lady Selborne, pure white, a sport from James Salter. A noble, highbuilt flower of splendid substance is Eda Prass, lilac, turning to blush; Eynsford White is well namedit is a fine flower. J. B.

MESSRS, JAS, VEITCH AND SONS.

Like all other garden plants, the Chrysantheimum is grown in considerable numbers by this extensively known firm at Chelsea. The collection differs, however, in one characteristic from most of those belonging to the trade that we have already noticed. Messrs. Veitch do not raise seedlings each year, and as one sees the plants, fresh from viewing Chrysanthemums elsewhere, it is noticed that the varieties represented are known ones, and there is an absence of a great number of "promising" and "unpromising" novelties, that one usually has to inspect and criticise. Still, if this work is not taken up, another task seemingly as difficult, is the endeavour to obtain all novelties of repute and value, and at the same time, keep the number of varieties grown from becoming unreasonably large. This weeding out and rejecting, in fact, is much the same in the case of such a collection as it is to the amateur grower, who wishes to keep abreast of the times. Previous to the exhibition of the National Chrysanthemum Society, there was a good dis-play arranged in one of the houses, and visitors to the establishment at that time had an excellent opportunity to see blooms of the popular kinds. The flowers have been rather below than above the average in point of size this season, and a few have opened less kindly than on some previous occasions. It is with some difficulty that plants which make part of their growth in the late summer, and have to develop their buds during September and October, are cultivated for exhibition blooms in such a populous district as Chelsea, but the task is a heavier one when September and October prove so unpropitions as they have been this season. It is interesting to hear, in view of the contiguity of the place to the metropolis, that one of the very best varieties during the present season has been Mis. H. Weeks. It is an extra large flower, of the Japanese type, white, faintly tinted with pink; the florets are of great width, and the flower when well grown is an unusually deep one. Modestum has given satisfaction also, and may be said to be one of the very best of the season's novelties. It has been described in these pages more than once; so have Australian Gold, Lady Byron, Mutual Friend, Nyanza, and M. Chenon de Leché. King of Chrysanthemums (Japanese), we have only seen good in a few instances; it is a very large flower, of a chestnut tint, but inclined to be a little rough. Le Moucherot'e, Oceana, Simplicity, Madame Rezaine, Mrs. Geo. West, and Amiral Avellan, were others of the newer ones noticed. The last named variety has many admirers, and is considered a good yellow Japanese. From our own point of viow, there are others of nearly the same colour which excel it. The excellent Australie that was exhibited well at the Aquarium shows, was not quite in character at Chelsea. The bloom when at its best is a superior incurved Japanese, all the florets of which incurve until the silvery reverse of each is alone seen. An incurved flower, by name Ideality, has been little evident this season; it was noticed at Chelsea, where it appeared to be of moderate promise. A glance was taken of a few of the other houses, where Bouvardias, Heaths, winter flowering Begonias, and other species were in

flower, but the blooms of the Begonias, and of the Orchids, will fall a prey, in more or less degree, to the next dense fog.

CATTLEYA \times LE CZAR. (?CATTLEYA LABIATA \times C.GRANULOSA)

Our illustration (fig. 104, p. 593) gives a representation of a very fine natural hybrid Orehid, exhibited by Messrs. Linden, l'Horticulture Internationale, Parc Leopold, Brussels, at the Royal Horticultural Society on October 27, when the Orchid Committee awarded it a First-class Certificate. Reference to our illustration of Cattleya × Vietoria Regina in the Gardeners' Chronicle, June 25, 1892, and eomparison with the illustration now given will serve to show that. although there is a certain resemblance, there are yet many points of difference, and these, from a florist's point of view, are decidedly in favour of Messrs. Linden's plant. The sepals are light lilae, with a greenish tinge; the petals lilac-rose, with very fine purple veining. The base of the lip is blush-white, the erected tips of the side-lobes purple; the leng isthmus joining the base to the front lobe of the lip, and which seems to indicate C. granulosa so markedly, is dark red, with some orange markings; the front lobe bright erimson purple, with a delicate lavendercolonred margin. It is a very fine Cattleya, and evidently a free grower.

NOTICES OF BOOKS.

THE FLORA OF DUMFRIESSHIRE, ETC. By G. F. Scott-Elliot, &c. (Dumfries: Maxwell & Son.)
In order to give a trustwenthy criticism of a book

In order to give a trustworthy criticism of a book of this character, the reviewer should have at least as intimate a personal knewledge of the flora as the author himself. As this is a state of things not generally attainable, it is only possible to fall back on generalities. The topography is specially the work of Mr. Scott-Elliot, who is an accomplished traveller, and can consequently condense into a few pages details that, to a less experienced observer, would demand a much larger space. Mr. Scott-Elliot is also respensible for most of the information relating to insectvisitors. Various specialists have given their aid in the subjects of meteorology, goology, and the assistance of many others in furnishing particulars as to the habitats of particular plants is duly acknowledged. We are pleased to find that, not only is the topography of each species given, but that the particular conditions under which each grows are noted, e.g., in the ease of Thalietrum minus, we are told it occurs "on moist ground on whinstone seils or mud in sun or half-shaded and wind-sheltered places, in narrow ravines." An excellent map and indexes of the insects and plants mentioned are very important features of the work, which ne student of the betany of the border counties can afford to ignore.

OFFICIAL CATALOGUE OF THE NATIONAL CHRYS-ANTHEMUM SOCIETY, Jubilee Edition (London: E. W. Allen, 4, Avo Marie Lane; and Richard Dean, Hon. Sec., Ranelagh Road, Ealing).

The society, whose latest catalogue now lies before us, rendered a signal service to the Chrysanthemum-growing fraternity when it first resolved, twelve years ago, to publish an official eatalogue of the varieties of the popular autumn flower for the use of its members and exhibitors. Several editions, with intervening supplements, have appeared since then, and when we remember that 135 affiliated societies are bound by the terms of their affiliation to accept the catalogue as their standard on all disputed questions of classification and nomenclature, it will readily be seen how needful it is that frequent and careful revision should be made.

The Jubilee Edition in form resembles its predecessors in many respects, but great changes, almost amounting to a complete revolution, will be found in those leading sections beloved by exhibitors, viz., the Incurved and Japanese. Most of the varieties recognised as indispensable on the showboard at the date of the last revision have disappeared, and a multitude of more modern varieties have taken their place. Some slight alteration has taken place in the titles of the selected lists, for we find they now consist of Incurved, Japanese Incurved, Hairy, Reflexed, Large Anemones, Japanese Anemones, we notice that the committee has adopted a new method of arrangement. Instead of the varieties being registered under the initial letter of the first word in personal names, the reader must now seek for them under the first letter of the surname. Thus, Charles Davis will no longer be found under C, but under D; and Mdlle, Thérèse Rey under R instead of M. which comes the description of colour, form, peculiarity of floret, season, height, and a note of such as have been awarded Certificates by the Floral Committee.

From a literary point of view, a valuable contribution will be found in Mr. Harman Payne's bibliography of the Chrysanthemum, which contains a list of all the books and pamphlets, both English and

Fig. 104.—Cattleya x le czar: supposed natural hybrid. (see p. 502.)

Pompons, Pompon Anemones, Singles, and Earlies. The group known as Japanese Reflexed, owing to difficulties in distinguishing the differences between them and the ordinary Japanese, has been abolished, and the varieties forming that somewhat artificial division have been merged under the heading of Japanese in Section II.

The alphabetical list in the new issue is a continuation of the one given in the 1890 catalogue, and

This may prove at first a little difficult to some who have grown used to the old method, but on the face of it will seem to be the only rational method of cataloguing, and is a system already adopted by Chrysanthemum eataloguers in other countries. There has been no change made in the description of the selected varieties for show: the name of the flower comes first, followed by the raiser's name in brackets, then the date of distribution is given, after

foreign, that have been published during the past sixty years or more. These number eighty-three, and do not include anything of the nature of a trade catalogue. Many of them are of great rarity, and perhaps, from a cultivator's point of view, of little practical value, but they are interesting as illustrative of the manner in which the flower has been dealt with by horticultural writers in different parts of the world. The price of the new Jubilee Edition is 1s.

COLONIAL NOTES.

JAMAICA.

The Bulletia of the Botanical Department for September, 1896, contains a useful article on the cultivation of Oranges. Lemons, Citrons, &c., in Sicily and Calabria. Mr. Jenman continues his synoptical list of the Ferus of Jamaica.

CEYLON.

Mr. John Christopher Willis has been appointed, on the recommendation of Kew, to succeed to the post vacated by Dr. Trimen as Director of the Botanical Department, Ceylon, and whose subsequent death we recorded in our last issue. Mr. Willis is M.A. of Gonville and Caius College, Cambridge, and held for three years from 1890 the Frank Stuart Studentship for botanical research. At the time of his appointment he filled the posts of Senior Assistant to the Regius Professor of Botany in the University of Glasgow, and of Lecturer in Botany at Queen Margaret's College in that University. Mr. Willis left England for Ceylon on August 21 last. Mr. Willis is the author of a manual and dictionary of flowering-plants and Ferns, which is shortly to be published by the Cambridge University Press, in the biological series of the "Cambridge Natural Science Manuals." Morphology, natural history, and classification will all be treated of, and the two illustrated volumes will contain a glossarial index of English names, economic products, technical terms, &c.

CALCUTTA.

Mr. George Herbert Cave, a member of the gardening staff at Kew, has been appointed by the Secretary of State for India in Council, a gardener on probation on the staff of the Royal Botanic Gardens at Calcutta. Mr. Cave had served as sub-foreman in the Propagating-pits. He left London for Calcutta on September 18 last. Kew Bulletia.

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By $G_{\mathbb{R}}$ Woodgate, Gardener, Rolleston Hall, Burton-on-Trent,

Bush Pruit.—The bushes, espallers, and cordons of Gooseberries and Red and White Currants may now be pruned if finches are not troublesome. A great point in pruning the bushes is to keep the centres open, and the branches so arranged and sufficiently far apart, that space is allowed for the lateral growth If it is the practice to shorten these lateral shoots about midsummer, as was then advised, the buds at the base of them will now by prominent, and all the smaller side-growths should be pruned back to within half-an-inch of their base, which will still leave numerous fruit-buds. Do not keep any fruit-spurs which have got of great length, but remove them entirely; their place will soon be taken by younger ones. The shoots left on soon he taken by younger ones. The smoots per on the main branches should also be stopped close, if for the extension of the crown a bush has reached its allowed limit; whilst those on young bushes should he left from 6 to 8 inches or more in length, according to the habit of growth of the variety, stubbing-back all other shoots to half-an-inch. Cordons may need, if old, a new shoot or two laid in, and the old ones, or some of them, removed, which is perhaps a better method of growing Goo-eberries and Currents than the single-stemmed plant, as it admits of shoots being laid-in if some should die off, or have to be removed. All side-shoots or laterals must be spurred-in at the winter-pruning, and half out-back in July. Cordons and espaliers should be extended by laying in new shoots to form branches in time, and secondary shoots of various lengths left all over the area to be covered in the case of the latter. In pruning the Black Currant, remove the dead branches, and those which bear but little fruit, and cut away some of the branches which crowd each other, so that light may reach the centre of the bush. Be careful to collect all prunings of the Black Currant and burn them forthwith, in case the bud-mite should harbour on them; then afford the soil a good dressing of soot, and point it in lightly with the fork; and when the ground is frozen and will carry a wheelbarrow, dress it with farmyard-manure, giving the losslies a good dressing

to the distance that the roots extend. Wood for making cuttings of these bush-fruits may now be selected, which should be straight, and from 12 to 15 inches in length. When these are made into cuttings, remove all the buds, excepting those within 3 inches of the upper end, and insert them 6 inches deep, in rows, at 1 foot apart, and 6 inches between the cuttings, making the soil firm about them.

Trained Apples, Pears, Plums, and Cherries may have their branches unfastened from the walls, and the needed pruning performed. It is then a good time to re-point the walls if this be needed, thus destroying the favourite hiding places of insects. If some Portland cement be mixed with the lime used frost will not affect it. I would advise that where possible, the walls should be wired, which will preserve them, besides facilitating the training of the trees. In fixing the wire for fan-trained trees let it run two courses of bricks apart, and get it close to the wall, or nearly so, as it always becomes slack in time. For horizontally-trained Apple and Pear-trees the wires may be fixed 1 foot apart, and the wire should be fairly stout. Where anything has to be done to the walls, the trees, after being loosened and pruned, should be tied up in convenient-sized bundles, and supported by stakes some distance away from the wall.

Fig-trees should be protected from frost either by unfastening the branches from the wall, tying them up loosely in bundles, placing these on the ground, and covering them with clean straw and mats; or they may be thatched as they stand with straw, Asparagus-tops, &c., and cover the border with littery mannire.

THE KITCHEN GARDEN.

By CHARLES HERRIN, Gardener, Dropmore, Maidenhead.

Broccoli. As these have nearly completed their growth, means should be taken to harden and protect the stems against severe frost. Owing to the sort of weather we have experienced for the last two months, the growth of leaf has been luxuriant, and it is as a consequence soft, and in a condition to be readily injured by frost. If the land is well exposed (not inside garden walls), and not over rich, the plants will be in a better condition to withstand severe weather, whilst those in the rich soil of the garden will succumb in large numbers. If growth is luxuriant, the present is a suitable time to stay further growth by heeling over the plants; but before the work is begun, all decaying or yellowing leaves should be stripped from the stems. Begin by taking out two spadefuls of soil from the northern side of each plant in the first row, and with a spade or fork from behind gently lift the plant slightly, press the stem over into the hollow thus made, taking a similar amount of soil from the next row of plants to cover the stems after they are pressed down, slightly treading it or beating it with the back of the spade to make it firm, and so on from row to row until the whole quarter is finished. The soil should bury the stems up to the leaves, as it is at this point that the frost most injures them. Treated in this manner the Broccoli heads will be rather smaller than would be the case had they not been lifted, but if they are moderately strong, the heads will be large enough for the best table, whereas if left without heeling over and protecting the stems, the losses may be great, especially after a wet autumn, as the past has been.

Broad Beans.—Where it is not convenient to raise the earliest crop of Broad Beans in pots in a warmhouse for spring planting, the present is a suitable time to make a sowing in the open ground. The ground should be dug over, and a dressing of well-rotted minure incorporated with it; the ground should be consolidated in some way when dry on the surface, and the seed sown forthwith. Due allowance should be made for failure of some of the seeds, by sowing thicker now than would be required in warm weather; and if eventually the plants are crowded, they may be thinned or transplanted in early spring. Sow in double drills a few inches apart, these to be distant 3 feet if more than one double line is required. The Seville long-pod, or if a smaller Bean is liked, the Early Mazagan, a very hardy variety, may be sown.

Digging and Manuring.—Any ground unoccupied by crops should be trenched or dug simply one spit deep whenever the weather is favourable. Some idea of the position to be assigned to the various crops should be formed before the digging and manuring are commenced, and the land prepared accordingly. That ground which is intended for root crops will be the better

for not having a heavy dressing of rotten manure, and for these roots it is advisable to choose a piece of ground that was well-manured for some previous crep; and in the digging to work in a dressing of wood-ashes or charred refuse and soot, and if it be wood-asnes or charred reruse and soot, and if it be too rich in humus, quick-lime may be added. Trenching or digging two or more spits deep is generally of great advantage in the kitchen garden, but care should be taken not to bring to the surface the infertile subsoil, or in the case of heavy land, that which in its nature approaches clay. If the land is not in good heart to the depth of 3 spits, or 2, as the case may be, the soil lower than these should be opened-up with a pick or fork, and left in position. It does such subseil much good to mix with it lime, wood-ashes, and charred refuse; and the rougher parts of the garden rubbish-heap and half-decayed manure, the best manure being put below the top spit. Gas-lime, if used, should be scattered thinly over the surface, and be left a few weeks before digging it in; it is a valuable fertiliser and cleanser of the soil, and is valuable as a dressing where elubbing affects the Brassicas. The land should be left in a rough state, to be acted upon by the weather. In some cases, where the land is heavy, it may be advisable to defer digging until the spring, or a short time before sowing and planting become necessary.

PLANTS UNDER GLASS.

By JNO. McINTYRE, Gardener, Woodside, Darlington.

Epiphyllum truncatum.—Any of these useful plants which may be set with flower-buds should be placed in the forcing or other warm-house so that they may expand their flowers by the end of next month. Epiphyllum truncatum varieties always look well when grown as standards grafted on stocks of Pereskia, and are then excellent subjects for filling vases. Grown in small pots from cuttings, the plants make good subjects for filling baskets, edgings to stages, table decorative-material, &c.

Salvia patens and S. splendens, if cultivated for winter flowering, may, as regards a part of the stock, be pushed into flower by the aid of warmth, and being gross feeders, they will be benefited by the regular application of liquid-manure.

Euphorbia jacquinuylora.—A charming winter-flowering plant, and one which, when well grown, produces large quantities of flower-sprays, useful in a variety of ways, either when on the plant or cut from it. The plant does well planted in borders in a warm house, where its long shoots can be made to cover walls and trellises, and clothe pillars. I have sometimes observed the plant on the walls of vineries, but there is the drawback that it cannot be flowered so early in winter, although it comes in later on. To grow this species of Euphorbia, choose two parts peat, one of saud, and one of lime-rubbish. Where a wall is not available, the plant should be cultivated in a pot, the growths being pinched repeatedly during the season of growth, to induce bushiness. Afford a good heat at this season, and the sprays will be large.

Euphorbia pulcherrima (Painsettia).—If the plants are cultivated in a warm pit in the manner recommended in a previous Calendar, they should now be ready for removal to the show-house, where, dotted about amongst plants with large foliage, they will brighten the house for several months. This species may also be placed in a conservatory which is kept at intermediate temperature, and from this house they may, when required, be passed into the dwelling as decorative objects. Continue the use of some good fertiliser until such time as the bracts are fully developed.

thrysanthemums, now at their best, should be guarded from damp, which has given much trouble to gardeners this season. The plants should be well supplied with water at the roots, and even if the water be given to them early in the morning, it is almost impossible at this season, even with fire-heat, to get the atmosphere of the house dried up whilst daylight lasts. Damping is in my opinion the outcome of the plants and buds not being sufficiently ripened previous to housing. Mildew is very common this year, and will be best kept in check by dustings of flowers-of-sulphur. The present is a good time to look over the collection with the view of discarding such varieties as are inferior, or which do not succeed. This work of selection is absolutely necessary, so many new varieties coming out every year. Some of the recent introductions are so much in advance of the older varieties, that weeding out must be done if it be only to keep pace with the times. Particularly is this the case with the Japanese, Before discarding a variety it should have been

grown for three years, as the bought-in young plants are seldom satisfactory the first year. Any of the earlier plants which have done flowering should be cut down, and encouraged to form shoots for cuttings, and those that are shy to throw cuttings should be placed in warm quarters till shoots emerge at the base of the stem.

Potting Materials. - Lay in sufficient store of potting materials under cover to serve through the winter.

THE ORCHID HOUSES.

By W. H. WHITE, Burford, Dorking.

Calogyne Sanderiana.—The rare Corlogyne Sanderiana, now in full growth, onioys the temperature of the Cattleya-house, where it should be placed, so as to be afforded plenty of light, and supplied with an abundance of water until the growths are finished, when the supply should be gradually diminished, and until discontinued altogether. When the new pseudo-bulbs are mature, remove the plant to the cooler part of the intermediate-house, where the temperature in the winter is between 50° and 55°. If during rest the bulbs shrivel slightly, no ill-effects need be feared, as these soon get plump if, when the flower-spikes show, the plant is stood in a vessel of water for a few minutes

Masdevallia torurensis is now sending up its numerous flower-spikes of pure white flowers, which appear well above the green feliage. The plants should be kept in the coolest, shadiest part of the intermediate-house, where the flowers will remain in good condition for several weeks. Care must be taken not to give much water at the root at this season, or many of the leaves may be lost. It is a matter of common knowledge that the current season's spikes, if not cut off, will produce blooms again next year; but, as a rule, to let them remain weakens the plants, and it is better to remove them when the first flowers fade.

The Cool house.—The plants of Epidendrum vitellinnm are fast forming new pseudo-bulbs, and should be placed in the lightest position, and afforded plenty moisture at the root until the growths are fully made up, when drier treatment should be the rule till the flower-spikes commence to push forth. Trichesma snavis is worth enltivating if only for the fragrance of its flowers. The plant is now starting into growth, and may require re-potting. In re-potting it, ordinary Orchid-compost, with plenty of clean crocks, should be made use of. The rare Odontoglossum madrenso is undoubtedly one of the most distinct and handsome of cool-house Orchids, of which its delicionsly-fragrant flowers have formed a special feature at Burford for many weeks. Usually by the time that the flowers fade the pseudo-bulbs are fully made up, but if the spike be cut as soon as the blooms are open, the pseudo-bulhs are only about half-grown through, and such being the case, the plant should be generously treated till the pseudo-bulbs are fully matured. Afterwards, and while at rest, just afford sufficient water to preserve the roots from perishing and the peudo-bulbs from shrivelling. The best time to re-pot the plant is when the new roots push from the base of the last-made growth; and it is good practice to confine the roots to the smallest possible-sized pots. Fresh fibrous peat, with a small addition of chopped sphagnum-moss, form a suitable compost, good drainage being very essential.

Calanthes.—The pseudo-bulbs of the deciduous species of Calanthes are now of full size, and showing for flower. At this period there must be no drying up of the soil, but a moderate amount of water should be afforded till all the flowers are expanded, when water should be gradually withheld. When in bloom, the plants should be arranged in the cooler part of the house, and where it is possible to keep their immediate surroundings somewhat drier than the other occupants of the house.

Dendrobium Phalanopsis.—Well-rooted plants of this beautiful species now form a feature in Orchidhouses, with their long, arching flower-spikes and great variety of colour in the flowers. While the plants remain in bloom they may be placed with the Calanthes, the drier atmosphere afforded those favouring the lasting of the flowers. After the spikes are removed, place the plants in the lightest part of a house the winter temperature of which does not fall below 60. Only just sufficient water to prevent undue shrivelling is required at that season.

Phalanopsis Schilleriana and P. amabilis.—Such of these plants as have made up their leaves and are now pushing up their flower spikes will require the
